                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes a novel isolated nucleic acid that encodes one of three new isoforms of human pregnancy associated plasma protein E, hpAPP-E. The products of the invention have abortive and contraceptive activity and can be used for gene therapy or in a vaccine. The nucleic acid, polypeptide encoded by it, or antibody to the polypeptide can be used in pharmaceutical compositions or vaccines for preventing or aborting pregnancy. PAPP-E is used in the antenatal diagnosis of dysgenetic pregnancies. The nucleic acids are used as probes to assess the level of PAPP-E isoform mRNA in chorionic villus samples, and the artibodies can be used to assess the expression levels of PAPP-E isoform proteins in chorionic villus samples, to diagnose dysgenetic pregnancies antenatally. This sequence represents an oligomer used in scanning the human PAPP-E genes described in the disclosure of the invention
                                                                                                                                                                                                        PAPP-E; human; pregnancy associated plasma protein E; abortive; contraceptive; gene therapy; vaccine; pregnancy; antenatal; diagnosis; dysgenetic pregnancy; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated nucleic acid encoding an isoform of human pregnancy associated plasma protein E, for preventing or aborting pregnancy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch.

CC perfect match, perfect mismatch, antisense match or antisense mismatch.

Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation to a DNA library, of at least one target sequence. The method of analysis comprises

CC compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises

CC probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, cor family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acids further comprises in Southern, Northern or dotor probes is useful in in situ hybridisation, in Southern, Northern or dotor mutations of any gene, in mapping the 5' termini of mRNA molecules by primer extensions of any sene, in mapping the 5' termini of mRNA molecules by containing segments of DNA that have been consolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarary. Note: The sequence cut at for this patent can also be obtained in electronic format directly from USPTO at sequence. Thun
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   .

acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises which is acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a grass-appeales comparison. Bach of the nucleic acids further comprises a grass-appeales comparison. Bach of the nucleic acids further comprises a tag sequence. The array of nucleic acid further comprises a grass-appeales or specific mutations of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence of the form the patent can also be obtained in electronic format directly form.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                invention discloses a microarray comprising a plurality of nucleic

complementary to particular genes, and can be used as probes for a variety of analyses such as gene expression analysis. Each probe comprises 9 or more consecutive mucleotides from at least one of 14936 nucleotide sequences defined in the patent, or their perfect sense match, sense mismatch, antisense match or antisense mismatch oligonucleotides. The probes may be used in an array comprising at least 10 distinct.

The probes may be used in an array comprising at least 10 distinct nucleic acid probes. The array is useful in monitoring gene expression levels by hybridisation to a DNA library, in analysing genetic variations, and in hybridising tag-labelled compounds. The probes are useful in in situ hybridisations, in screening cDNA or genomic libraries or useful in in situ hybridisations, in screening segments of DNA constructions subclones) for additional clones containing segments of DNA conserved subclones) for additional clones containing segments of DNA conserved subclones) for additional clones containing segments of the hard have been previously; solated and sequenced, in southern, northern, or dot-blot hybridisation of genomic DNA to identify or detect the sequence of any gene or detect specific mutations in any gene, and in nucleic acid sequences of the invention of nucleic acid sequences of the invention of nucleic acid sequences of the invention of nucleic acid sequences of the arage collection of any sequences of the invention of nucleic acid sequence data for this patent was obtained in electronic format the sequence data for this patent was obtained in electronic format the sequence and sequences of the invention of the sequence of any set e at sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New probe array useful e.g. for monitoring gene expression levels, for analyzing genetic variations, or for hybridizing tag-labeled compounds. comprises multiple nucleic acid probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The present invention relates to nucleic acid sequences that are complementary to particular genes, and can be used as probes for a variety of analyses such as gene expression analysis. Each probe comprises such as gene expression analysis. Each probe mucle consecutive nucleotides from at least one of 14336 nucleotide sequences defined in the patent, or their perfect sense match, antisense match or antisense mismatch, antisense match or sense match or probes may be used in an array comprising at least 10 distinct nucleic acid probes. The array is useful in monitoring gene expression levels by hybridisation to a DNA library, in analysing genetic variations, and in hybridisations, in screening compounds The probes are useful for identifying family members of a gene. The probes are also useful in in situ hybridisations, in screening cDNA or genomic libraries (or derived subclones) for additional clones containing segments of DNA that have been previously isolated and sequenced, in Southern, northern, or dot-blot hybridisation of genomic DNA to identify or detect the mapping the 5' termini of genomic DNA to identify or detect the mapping the 5' termini of mRNA molecules by primer extensions. The mapping the 5' termini of mRNA molecules by primer extensions. The mapping the 5' termini of mRNA molecules by primer extensions.

The invention provides a large collection of mcleic acid sequences of the invention were data genes with a wide range of analytical uses.

ACH50865-ACH65260 represent the target sequences of the invention. Note:

The sequence data gone spatent was obtained in electronic format
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   directly from the USPTO web site at segdata.uspto.gov/psipsDIDEntry.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New probe array useful e.g. for monitoring gene expression levels, for analyzing genetic variations, or for hybridizing tag-labeled compounds, comprises multiple nucleic acid probes.
tag-labelled compound, gene family, in situ hybridisation, library screening, Southern hybridisation; northern hybridisation; dot-blot hybridisation, gene sequence; mutation detection; target sequence; probe; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

Single multiplex PCR primer #277.

15-JUL-2004 (first entry)

ADO10905;

```
The invention relates to a method of designing primers for simultaneous amplification of target DNA fragments in a single multiplex polymerase chain reaction by aligning a first primer and a second primer. The method comprises: (a) aligning a first primer and a second primer; and (b) comprises: (a) aligning a first primer and a second primer; and (b) contain four or more bases that are perfectly matching to the 3' end does not contain four or more bases that are perfectly matching contain four or more bases that are perfectly matching contain some no mismatch to the 3' end sequence of the first primer at its 3' end does not contain six or second primer, the first primer at its 3' end does not contain six or correct bases that are perfectly matching to a sequence anywhere of the first primer or the second primer, and the first primer or the second primer. The method is useful for designing primer or the second contain eleven or more bases that are perfectly matching except one mismatch to a sequence anywhere of the first primer or the second primer. The method is useful for designing primers for simultaneous amplification of target DNA fragments in a single multiplex polymerase contain reaction. It is also useful in the identification of multiple genes contain the primer or the denotyping that the primer or the denotyping that the primer or the denotyping that the denotyping that the process of the denotyping that the denotyping the denotyping the designing primer describers that the denotyping that the denotyping that the denotyping that the denotyping the designing primer describers that the denotyping that the denotyping that the denotyping that the denotyping the designing primer describers the designing primer describers that the denotyping the designing the describers the describers that the denotyping the describers the describers the describers the describers the den

The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n. (dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. The sequences AAT66084-T66107 represent repeat sequences of low informativeness found in specific human genes. This repeat sequence is found in the haemoglobin gamma G gene located at chromosomal position 11p15.5. The sequence is amplified by primers AAT66094-5. (Updated on 25-MAR-2003 to correct PF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ribozyme; hairpin; hammerhead; gene therapy; vasotropic; restenosis; ss.
                                                                                                                                                                                                       Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n-using novel nucleic acid mols. as primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1, PCNA and Cyclin B1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a hairpin or hammerhead ribozyme,

                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 by with an (ACIIs and a (TCI)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100,000. The sequence information of for ca. 230 such bovine microsatellites is summarised in the sequence information of specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the microsatellite (using the program OFTTRRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. This invention describes a novel method for obtaining DNA of unknown sequence flanking a single site of known sequence involves single site of amplification of circular DNA template flanking a trarget DNA of known camplification of circular by the sequence using a polymerase having strand displacement capability. The method is used for obtaining a particular target DNA sequence that can be useful as templates that contain entire simple sequence repeat (SSR) alleles for amplification (SSA) procedures e.g. PCR or can be employed as molecular markers, e.g. in distinguishing between species, strains or varieties within species or identifying the presence of a disease condition. It also provides a marker for use in areas such as import and export regulation, variety and ecotype identification, marker condition. It created a linear DNA molecule containing two target sequences in sequences in sequences within a single stranded DNA template and flanking regions for these target sequences. It can also be used for e.g. for cloning cDNA or genomic DNA which flanks any known short target sequence. The present method can also be used to obtain entire coding regions of the present method can also be used to obtain entire coding regions of the present method can also be used to obtain entire coding regions of the present method can also be used to obtain entire coding regions of the present method can also be used to obtain entire coding regions of the present method can also be used to obtain entire coding regions of the present method son also be used to obtain entire coding regions of the present method son also be used to obtain entire coding regions of the present method son also be used to obtain entire coding regions of the present method son also be used to obtain entire coding a degenerate
                                                                                                                                                                                                                                                                                                   ö
designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1. Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in restenosis treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Obtaining unknown DNA sequence flanking a single known sequence for use as PCR templates, involves single site amplification with polymerase having strand displacement capability.
                                                                                                                                                                                                                                                                                                   Gaps

using a polymerase having strand displacement capability which can synthesize up to 10 kb fragments. This is especially useful for obtaining plant genes which are usually less than 10 kb in length. The method allows accelerated development of high resolution DNA markers that may be used for fingerprinting, mapping etc., using small amounts of tissue (less than 1 mug). It also allows the production of a PCR template with knowledge of only one region of target DNA sequence, the size of which is regulated only by the primer design. The present method also eliminates genomic DNA library preparation and screening which are the most time consuming steps, typically requiring no less than three months, with total time for target DNA development being between 4.6 months. AA289469-289474 represent primers used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes a novel method for obtaining DNA of unknown sequence flanking a single site of known sequence involves single site amplification of circular DNA template flanking a target DNA of known sequence using a polymerase having strand displacement capability. The method is used for obtaining a particular target DNA sequence that can be useful as templates that contain entire simple sequence repeat (SSR) alleles for amplification (SSA) procedures e.g. PCR or can be employed as molecular markers, e.g. in distringuishing between species, strains or varieties within species or identifying the presence of a disease condition. It also provides a marker for use in areas such as import and export regulation, variety and ecotype identification, marker development, forensic DNA fingerprinting, etc. The method can also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Obtaining unknown DNA sequence flanking a single known sequence for use as PCR templates, involves single site amplification with polymerase having strand displacement capability.

trom one sequence within a single stranded DNA template and flanking concessions for these target sequences. It can also be used for e.g. for coloning cDNA or genomic DNA which flanks any known short target sequence. The present method can also be used to obtain entire coding regions of genes based upon a known nucleic acid sequence or by using a degenerate nucleic acid sequence derived from amino acid sequence back translation using a polymerase having strand displacement capability which can using a polymerase having strand displacement capability which can using a polymerase having strand displacement capability which can using a polymerase having strand displacement capability which can using a polymerase which are usually less than 10 kb in length. The method also plant genes which are usually less than 10 kb in length. The method also plant genes which are usually apply the production DNA markers that may be used for fingerprinting, mapping etc., using small amounts of tissue the finally. It also allows the production of a PCR template with knowledge of only one region of target DNA sequence, the size of which is regulated only by the primer design. The present method also eliminates genomic DNA library preparation and screening which are the most time consuming steps, typically requiring no less than three months, with the total time for target DNA development being between 4-6 months, with the total time for target DNA development being between 4-6 months, with 85888888888888888888888888888888

Composition for modulating transcription or replication of a pre-selected target sequence and for treating a plant or animal disease, comprises a recombinase and two probes, each containing a homology clamp and an anchoring sequence.

Disclosure, Fig 9, 103pp; English.

The present invention relates to a composition comprising a recombinase and two complementary single stranded probes each containing at least one homology clamp corresponding or complementary to a preselected target nucleic acid sequence and at least one annobring sequence. The present sequence is a heterologous insert sequence used to generate the probes that can be used in the present invention. The composition of the present invention can be used to modulate transcription or replication of a pre-

selected target sequence, treat a disease state of a plant or animal caused by expression of a disease gene, detect a double stranded nucleic acid target sequence, isolate either strand of a double stranded target sequence, isolate either strand of a gene family, produce a transgenic non-human organism or plant, determine the function of a double stranded nucleic acid target sequence and inhibit double stranded nucleic acid target sequence and inhibit composition may be used to produce animal models for genetic defects 8888888888888

Composition for modulating transcription or replication of a pre-selected target sequence and for treating a plant or animal disease, comprises a recombinase and two probes, each containing a homology clamp and an anchoring sequence.

Disclosure, Fig 9; 103pp; English.

The present invention relates to a composition comprising a recombinase and two complementary single stranded probes each containing at least one thom two complementary single stranded probes each containing at least one and two complementary to a preselected target nucleic acid sequence and at least one anchoring sequence. The present sequence is a heterologous insert sequence used to generate the probes that can be used in the present invention. The composition of the present invention can be used to modulate transcription or replication of a preselected target sequence, treat a disease state of a plant or animal caused by expression of a disease strand of a double stranded nucleic acid target sequence, isolate either strand of a double stranded target sequence, isolate either strand of a member of a gene family, produce a transgenic non-human organism or plant, determine the function of a composition or nucleic acid rotation or branch migration. In addition, the composition may be used to produce animal models for genetic defects

Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.

Example 1; Page 318; 408pp; English.

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (I) which cleaves RNA encoding a cytokine involved in callozyme (I) which cleaves RNA encoding a cytokine involved in information, matrix metalloproteinase (MMP), cyclin, cell-cycle callozed segment encoding (I) (I) comprising a promoter operably linked to a nucleic acid molecule (II) comprising a promoter operably linked to a concleic acid segment encoding (I) (I) can have antipsoriatic, and nucleic acid segment encoding (I) (I) can have antipsoriatic, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing sear and solved and such as keloid, adhesion and hypertrophic or hypertrophic burn scar. AMR57577 to AMH62099 represent sequences used in the complification of the present invention

Detecting polymorphisms in uridine diphosphate glucuronosyltransferase gene promoter, useful for optimizing drug dosages for a patient, comprises determining the presence of five thymidine-adenine repeats in the promoter.

Example 6; Col 11; 13pp; English.

The invention relates to detecting (M1) polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter by determining the prosence of five thymidine-adenine (TA) repeats in the promoter, where the presence of the five TA repeats correlates with increased expression of the gene. The method is used for detecting polymorphisms in a UGT gene promoter, the preferably a UGT 1 (UGTAI) gene promoter. (M1) is cativity, for optimising draugh desages for a patient, where the drugs cativity, for optimising draugh desages for a patient, where the drugs (e.g. Trinotecan or TAS-103) are glucuronidated by UGT (preferably UGTIAI) and the activity of the drug is effected by its level of glucurodination. The method preferably involves obtaining DNA from an individual, amplifying all or part of a UGT gene promoter (UGTIAI) gene promoter (UGTIAI) gene promoter. Thus the DNA being amplified comprises all or part of in the promoter. Thus the DNA being amplified comprises all or part of the number of TA repeats is determined by gel electrophoresis or by the number of five TA repeats (TA) is, TA repeats chain reaction and consisting of five TA repeats (TA) is, TA repeats or DNA repeats (TA) is, (TA) is also useful for predicting an individual an individual and uGT (preferably continity the number of TA repeats correlates custoff the number of TA repeats correlates

C

```
The invention relates to detecting (MI) polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter by determining the presence of five thymidine-adenine (TA) repeats in the promoter, where the presence of the five TA repeats correlates with increased expression of the gene. The method is used for detecting polymorphisms in a UGT gene promoter, preferably a UGT I (UGT1A1) gene promoter. (MI) is useful for screening individuals for variation in glucuronidation activity, for optimising drug desages for a patient, where the drugs (e.g. Irinotecan or TAS-103) are glucuronidated by UGT (preferably CUT1A1) and the activity of the drug is effected by its level of glucurodination. The method preferably involves obtaining DNA from an individual, amplifying all or part of a UGT gene promoter (UGT1A1 gene promoter) contained in the DNA being amplified comprises all or part of UGT1A1 promoter. Thus the DNA being amplified comprises all or part of UGT1A1 promoter. The DNA is amplified by gel electrophoresis or by sequencing the amplified DNA. The polymorphism comprises an allele
with expression of the UGT gene, and the individuals sensitivity to xenobiotics is effected by glucuronidation activity. The methods preferrably involve determining the presence of five, six or seven TA repeats in the promoter. Defects in glucurodination is associated with Gilbert's syndrome (hyperbilirubinaemia) and Crigler-Najjar syndrome. The present sequence is the UGTIA1 promoter (TA)8 repeat region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Detecting polymorphisms in uridine diphosphate glucuronosyltransferase gene promoter, useful for optimizing drug dosages for a patient, comprises determining the presence of five thymidine-adenine repeats in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; ds; UGT1A1; promoter; Gilbert's syndrome; hyperbilirubinaemia;

consisting of five TA repeats (TA)5, six TA repeats (TA)6, or seven TA repeats (TA)7. The promoter has any one of the genotypes (TA)5, (TA)5, (TA)6, (TA)6, (TA)6, (TA)7, (TA)6, (TA)7, (TA)6, (TA)7, (TA)7, (TA)7, (TA)7, (TA)8 or TA)6, (TA)8. (TA)9, (TA)9, (TA)9 or TA)6, (TA)9, (TA)9 or TA)6, (TA)9, (TA)9 or TA)9 or TA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention comprises a method for detecting polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter (preferably UGT1A1). The method involves determining the number of thymidine-adenine (TA) repeats in the promoter. -as the number of TA repeats correlates with expression of the UGT gene. The method of the invention is useful for detecting polymorphisms in a UGT gene promoter. The method of the invention is also useful in optimising drug dosages and predicting an individual's sensitivity to xenobiotics for drugs and xenobiotics that are glucuronidated by UGT. The present DNA sequence represents a UGT gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Detecting polymorphisms in uridine diphosphate glucuronosyltransferase gene promoter, useful for optimizing drug dosages for a patient, involves determining number of thymidine-adenine repeats in the promoter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human uridine diphosphate glucuronosyltransferase gene polymorphism #15.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0.5%; Score 17.4; DB 1; Length 19;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention comprises a method for detecting polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter (preferably UGTIA1). The method involves determining the number of thymidine-adenine (TA) repeats in the promoter - as the number of TA repeats correlates with expression of the UGT gene. The method of the invention is useful for detecting polymorphisms in a UGT gene promoter. The method of the invention is useful in optimising drug dosages and predicting an individual's sensitivity to xenobiotics for drugs and xenobiotics that are glucuronidated by UGT. The present DNA sequence represents a UGT gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Detecting polymorphisms in uridine diphosphate glucuronosyltransferase gene promoter, useful for optimizing drug dosages for a patient, involves determining number of thymidine-adenine repeats in the promoter.

The invention relates to a novel set of inter-simple sequence repeats (ISSR)-PCR primers for genotyping eukaryotes. The primers of the invention may be useful for genotyping diverse genomes of plant and animal systems, in particular for distinguishing Basmati rice varieties from non-Basmati rice varieties and traditional Basmati rice varieties from evolved Basmati rice varieties. The current sequence is that of the ISSR-related PCR primer of the invention.

double-stranded short interfering nucleic acid; short interfering nucleic acid; siNA; downregulation; vascular endothelial growth factor receptor; VEGFR; antiangiogenic; cytosteatic; antidiabetic; ophthalmological; antiarthritic; antipsoriatic; nephrotropic; gynaecological; angiogenesis-associated condition; cancer; diabetic retinopsthy; macular degeneration; neovascular glaucoma; arthritis; psoriasis; endometriosis; angiofibroma; polycystic kidney disease; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (downregularing) the expression of VEGER genes. The siNA are potentially useful for treating a wide range of angiogenesis-associated conditions, particularly cancers, diabetic retinopathy, macular degeneration, neovascular glaucoma, arthritis, psoriasis, endometriosis, angiofibroma, and polycystic kidney disease. The siNA may also be useful for diagnosis, drug screening, target identification and validation, genetic engineering, studying gene function, and also for gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        nucleic acid (siNA) that downregulates expression of the vascular endothelial growth factor receptor (VEGFR) gene. Also described: (1) a siNA that downregulates the VEGFR) gene, (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; (4) vectors that express siNA; and (5) single-stranded siNA with similar properties. The siNAs have antianglogenic, cytostatic, antidiabetic, ophthalmological, antiarbritic, antipsoriatic, nephrotropic and gynaecological activities. The siNA are useful for modulating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    double-stranded interfering nucleic acid, useful e.g. for treatment diagnosis of cancer, downregulates the vascular endothelial growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         present invention describes a double-stranded short interfering
                                                                        Human VEGFR3 short interfering nucleic acid (siNA) SEQ ID NO:1689
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example 3; SEQ ID NO 1689; 207pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New
```

```
The present invention describes a double-stranded short interfering nucleic acid (siNh) that downregulates expression of the vascular endothelial growth factor receptor (VEGER) gene. Also described: (1) a sink that downregulates the VEGF gene; (2) kits for in vitro or in vitro and vitro or in vitro or in vitro or in vitro or or vitro or or vitro or or vitro vitro or vit
                                                                                                                                                                                                                                                                                                                                                                                  double-stranded short interfering nucleic acid; short interfering nucleic acid; slAA; downregulation; swearlar endothelial growth factor receptor; VEGFR; antiangiogenic; cytostatic; antidiabetic; ophthalmological; antiatchritic; antipsoriatic; nephrotropic; gynaecological; angiogenesis-associated condition; cancer; alabetic retinopathy; macular degeneration; neovascular glaucoma; arthritis; psoriasis; endometriosis; angiofibroma; polycystic kidney disease; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New double-stranded interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer, downregulates the vascular endothelial growth
                                                                                                                                                                                                                                                                                                                                         Human VEGFR3 short interfering nucleic acid (siNA) SEQ ID NO:1923.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Example 3; SEQ ID NO 1923; 207pp; English.

that express siNA; (3) conjugates and/or complexes of siNA; (4) vectors that express siNA; and (5) single-stranded siNA with similar properties. The siNAs have antiangiogenic, cytostatic, antidiabetic, cophthalmological, antiarthritic, antipsoriatic, nephrotropic and synaecological activities. The siNA are useful for modulating (Gownregulating) the expression of VEGFR genes. The siNA are potentially useful for treating a wide range of angiogenesis-associated conditions, particularly cancers, diabetic retinopathy, macular degeneration, neovascular glaucoma, arthritis, psoriasis, endometriosis, angiofibroma, and polycystic Kidney disease. The siNA may also be useful for diagnosis, cand polycystic Kidney disease. The siNA may also be useful for diagnosis, cand polycystic studying gene function, and also for gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

The present inventions described according to the vascular endothelial growth factor receptor (VEGFR) gene. Also described: (1) a sink that downregulates the VEGF gene; (2) kits for in vitro or in vitro delivery of sink; (3) conjugates and/or complexes of sink; (4) vectors that downregulates the VEGF gene; (2) kits for in vitro or in vitro delivery of sink; (3) conjugates and/or complexes of sink; (4) vectors that express sink; and (5) single-stranded sink with similar properties. The sinks have antianglogenic, cytostatic, nephrotropic and gynacological, antiarthritic, antipsoriatic, nephrotropic and gynacological activities. The sink are useful for modulating convegulating the expression of VEGFR genes. The sink are potentially useful for treating wide range of angiogenesis—associated conditions, particularly cancers, diabetic retinopathy, macular degeneration, neovascular glaucoma, arthritis, psoriasis, endometriosis, angiofibroma, and polycystic kidney disease. The sink may also be useful for diagnosis, drug screening, target identification and validation, genetic congineering, studying gene function, and also for gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence is used in the exemplification of the present invention.
double-stranded interfering nucleic acid, useful e.g. for treatment diagnosis of cancer, downregulates the vascular endothelial growth
                                                                                                                                                                                               present invention describes a double-stranded short interfering

Inspection of flat epithelial cell, screening of treating or preventive agents for flat epithelial cancers, the treating or preventive agents for flat epithelial cancer.

Example; Page 8; 18pp; Japanese.

The present invention describes a method for the inspection of flat epithelial cells in which it is judged that flat epithelial cells separated from an organism can proceed to flat epithelial cancer when the

```
2128th base in fibroblast growth factor receptor (FGFR) gene of the cells is mutated from quanine to thywine. Also described is a method for screening treating or preventive agents for flat epithelial cancers in which a candidate substance of treating agent for flat epithelial cancer is applied to flat epithelial cancer cells producing FGFR protein in which the 2128th (exon 17) amino acid in FGFR3 gene is mutated from guanine to thymine or the 697th amino acid is mutated from guanine to thymine or the 697th amino acid is selected by using the facts that the 2128th base in the flat epithelial cell FGFR3 gene after the application returned to quanine and that the 697th amino acid of FGFR3 protein produced returned to glycine as the indices. The method is used for the inspection of flat epithelial cells. The present sequence represents a mutagenesis primer for human FGFR3, which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                      ő
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 useful e.g. for treatment and down regulates expression of at least
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a short interfering nucleic acid (siNA) that down regulates expression of at least one cyclin gene by RNA interference, siNA are used to modulate expression of cyclin genes, in,

cells, tissue explants or organisms, e.g. for treating a wide range of cancers and other cell-proliferation disorders such as restenosis, but also for drug screening, diagnosis, target identification and validation; genetic engineering, pharmacogenomics, studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents the lower strand of cyclin D1 targeted double stranded siNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer and restenosis, down regulates expression of at least

                                                                                                                                                                                                                                                                                                                                                                                                              8
```

The present invention relates to a short interfering nucleic acid (siNA) that down regulates expression of at least one cyclin gene by RNA interference. SINA are used to modulate expression of cyclin genes, in cells, tissue explants or organisms. e.g. for treating a wide range of cancers and other cell-proliferation disorders such as restenosis, but also for drug screening, diagnosis, target identification and validation, genetic engineering, pharmacogenomics, studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents the upper strand of cyclin D1 targeted double stranded sinA which is identical to the cyclin D1 transcript target sequence.

```
The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each Vbeta gene, VbetaRNA or CDNA. The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases. Concluding autoimmune disease, degenerative nervous system diseases, carefulous diseases include Addison's diseases. Cond neoplastic disease. Autoimmune diseases include Addison's disease. Cond neoplastic disease. Autoimmune diseases include Addison's disease. Cond neoplastic disease. Autoimmune diseases include Addison's disease. Cond neoplastic disease. Hypersensitivity diseases include Type: I hypersensitivities such as contact with allergens that lead to allergies. Type II hypersensitivities such as those present in Goodpasture's syndrome and Type IV hypersensitivities such as those manifested in leprosy. Infectious diseases include viral infections

(UYNY) UNIV NEW YORK STATE RES FOUND. Lane MJ; Benight AS, Faldasz BD, uncing double stranded nucleic acid molecules with preselected values free energy parameters such as affinity for nucleic acid binding Producing double stranded

WPI; 2000-194826/17

This invention describes novel methods of producing double stranded nucleic acid molecules with a preselected value for a free energy parameter (e.g. a preselected T m or a preselected affinity for a nucleic acid binding ligand). The method involves preparing a first double carid binding ligand. The first value of a first free energy parameter of the first redefence value of a first free energy parameter for a reference first reference value of a first free energy parameter for a reference double-stranded nucleic acid comprising a reference binding site for the light reference value of a first free energy parameter for a reference binding of a light than, equal to or lower than (sic). The method relationship is higher than, equal to or lower than (sic). The method comprises: (a) determining a test value for a test double stranded cucleic acid, comprising a test value for a test double stranded complementary strands of double stranded nucleic acid, (b) comparing the first value to a reference value) of the cacond free energy parameter for the reference value) of the cacond free energy parameter for the reference value) of the accond free energy parameter for the reference value) of the accond tree energy parameter for the reference value of the cacid, and (c) if the test value and the second reference value of the Disclosure; Col 71-72; 49pp; Énglish. ligands.

second free energy parameter exhibit a test relationship that is the same as the preselected relationship, then preparing a first double stranded nucleic acid comprising all or part of the test nucleic acid, but if the test relationship is different than the preselected relationship, repeating step (a) and (b) on one or more additional test double stranded nucleic acids until an additional test double stranded and is dentified in which the test relationship is the same as the preselected comprising all or part of the additional test nucleic acid. AZ288875ö a nucleic This invention describes novel methods of producing double stranded nucleic acid molecules with a preselected value for a free energy parameter (e.g. a preselected I m or a free energy parameter (e.g. a preselected I m or a preselected affinity for a nucleic acid binding ligand). The method involves preparing a first double stranded nucleic acid comprising a binding site for a nucleic acid binding ligand. The first value of a first free energy parameter of the first couble stranded nucleic acid has a preselected relationship with a first reference value of a first free energy parameter for a reference binding of a ligand uncleic acid comprising a reference binding site for the binding of a ligand of interest to its binding site and the preselected relationship is higher than, equal to or lower than (sic). The method comprises: (a) determining a test value for a test double stranded nucleic acid, comprising a test binding site for the ligand, of a second Producing double stranded nucleic acid molecules with preselected values for free energy parameters such as affinity for nucleic acid binding Gaps . 0 0.5%; Score 17.4; DB 1; Length 20; 94.7%; Pred. The present sequence is one of a number of antisense compounds of up to phosphenon pyruvate carboxykinaec-cytesolic (PECK-cytesolic). The antisense compounds are useful for inhibiting the expression of pytosolic in cells or tissues. They are commonly used as research reagents and in diagnostics, e.g. to elucidate the function of particular genes. They are also useful for distinguishing between functions of various members of a biological pathway and for research use. The antisense compounds are also useful prophylactically, e.g. to prevent or

Antisense compound capable of modulating the expression of phosphoenol pyruvate carboxykinase-cytosolic, useful for preventing or delaying infection, inflammation or tumor formation.

WPI; 2001-190979/19.

The invention relates to a map of the bread wheat D genome comprising the genome location of a microsatellite marker selected from a group of 185 genome location of a microsatellite marker selected from a group of 185 of left (ABQ92131-ABQ92137). The invention also encompasses the use of left (ABQ92191-ABQ93103) and right (ABQ93103-ABQ93187) primers to amplify and detect the microsatellite markers, and to identify genes responsible for a phencypic trait of interest in wheat. Wheat is an allohexaploid species consisting of 3 diploid genomes designated A, B and a lohexaploid species of the prome is thought to have been introduced in the most recent intercrossing, between the amphipioid AABB and Triticum to the polyptoid genome, the large size of its genome, and its low level of polymorphism, the genetic mapping of wheat has to date been difficult. Microsatellites are tandemly repeated sequences the want of polymorphism, the genetic mapping in length, mainly due to polymerase slippage during replication. This high degree of polymorphism makes them especially suitable for the genetic mapping of polymorphism makes them especially suitable for the genetic mapping of

species which show little intraspecies polymorphism, such as wheat. In addition, microsatellites are codominant, and exhibit Mendelian.

inheritance. The 185 microsatellite markers of the invention are developed from the ancestral diploid donor species Triticum tauschii and map to the wheat D genome, which is less polymorphic than the A or B genomes. These microsatellite markers thus help to overcome some of the problems associated with the genetic mapping of wheat. The wheat D genome invention are useful for identifying genes responsible for a phenotypic trait of interest, most notably OTLs (quantitative trait loci). In charticular they may be used for analysing genes and alleles implicated in disease and for identifying development factors, quality factors and factors conferring resistance to pathogens and xenobiotics. The microsatellite markers and associated primers may be used in microsatellite markers and associated primers may be also be used in microsatellite markers and associated primers may be also be used in mapping and genotyping diploid and polyphoid species of Triticum, particularly Aegilops, Triticum monococcum, Triticum durum, Triticum essetivum, or related species; for identifying cultivars and hybrids of Triticum and related species; to assess whether or not a product comprises wheat or a related species; and to assess whether or not a product comprises genetically modified wheat. The present sequence represents a specifically claimed Triticum tauschii/wheat genome D microsatellite marker right per primer of the invention. Isolated nucleic acid molecules having polymorphisms in known human genes e.g. cytochrome p450 and cathepsin S useful as genetic linkage markers for locating, identifying and characterizing the genes responsible for disorder-related traits.

Example 16; Page 131; 714pp; English.

This invention relates to the sequence of an isolated nucleic acid molecule comprising at least one base variation from that of a known molecule comprising at least one base variation from that of a known molecule comprising at least one base variation from that of a known human cytochrome P450 OZEI (CTP450D12), cytochrome P450 OZEI (CTP450D12), adrenergic receptor betal (ADBRI), cytochrome P450 OZEI (CTP50D12), adrenergic receptor betal (ADBRI), cytochrome P450 OZEI (CTP50D12), adrenergic receptor unclear translocator (ARNT), cathepsin S (CTPS), cyclooxgenage 2 (CTP2), diazepam binding content (FLAP), plutathione-S-transferage 12 (GST2), histanie-N-methyl transferase (HNWT), NADPH quinone S-transferase 2 (GTP3), unchande -N-methyl cransferase (HNWT), NADPH quinone saidoreducase 2 (NOO2), cransferase (HNWT), NADPH quinone saidoreducase 2 (NOO2), alloctoransferase (HNWT), natochromatic 2) KIXI, nicothramide -N-methyl cransferase (HWTS181), urokinase receptor (MR12), upp-glucuronosyl transferase (MRP3), upp-glucuronosyl transferase (MRP3), orphan nuclear receptor (NR12), or acetylcholine muscarinic (MRP3), orphan nuclear receptor (NR12), or acetylcholine muscarinic (MRP3), orphan nuclear receptor (MR12), or acetylcholine muscarinic cransferase (MRP3), orphan nuclear receptor (MR12), or acetylcholine muscarinic cransferase (MRP3), orphan nuclear receptor (MR12), or acetylcholine muscaring and characterising the genes that care responsible for a variety of disorder-related craits as a result of traits and results of the compression, constitutive cransfersion, mutation or underexpression, which may be used in disquence contained in CYP4501A, CYP4501A, CYP4501A, CANT, EPHX2, GST12, NNMT, NOO2, NR112, STM, UGT284, UGT287, UGT284, UGT polymorphic DNA sequence of the invention

                                                                                                                                                                                                                                                                                                                                                                                                     The invention comprises isolated human gene sequences and PCR primer sequences which can be used to detect single nucleotide polymorphisms (SNPs). The DNA sequences of the invention are useful for detecting SNPs existing in human genes and for the diagnosis of human disease. The present DNA sequence represents a human gene PCR primer of the invention.
                                                                                                                                                                                                                                                                                                          Polynucleotide for detecting single nucleotide polymorphisms existing in human gene, contains isolated human gene having specified sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Polynucleotide for detecting single nucleotide polymorphisms existing in human gene, contains isolated human gene having specified sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            sequences which can be used to detect single nucleotide polymorphisms (SNPs). The DNA sequences of the invention are useful for detecting SNPs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention comprises isolated human gene sequences and PCR primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Score 17.4; DB 1; Length 20; Pred. transpected to human microsomal prostaglandin E2 synthase (mFGES-1). The human mpGES-1 gene is located on chromosome 9, more specifically to human mpGES-1 gene is located on chromosome 9, more specifically to gas-3. The present invention also describes: (1) antisense compounds, compounds, which specifically hybridise with the nucleic acid encoding mpGES-1, which specifically hybridise with the nucleic acid mpGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mpGES-1 in cells or tissues; and (3) a method of treating an animal comparison of antisense oligonucleotides and antisense compounds have cytostatic, cophinalmological, immunomodulatory and cardiovascular activities, and can be used as mpGES-1 inhibitors and in gene therapy. The antisense compound composition for treating a disease or condition associated with mpGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or cophinalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGBS-1). The targeted to human microsomal prostaglandin E2 synthase (mPGBS-1). The human mPGBS-1 gene is located on chromosome 9, more specifically to gasta. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGBS-1, which specifically hybridise with the nucleic acid encoding mPGBS-1, which specifically hybridise with the nucleic acid encoding mPGBS-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGBS-1. MPGBS-1 chimeric antidaheacid, immunomodulator, cardiant, neuroprotective, antidifiammatory, neuroprotective, notropic, antiarthritic, vasotropic, antidifiammatory, neuroprotective, notropic, antistrhities, and can ophthalmological, immunomodulatory and artiforascular activities, and can be used for preparing a composition for treating a disease or condition associated with mPGBS-1 e, inflammation, Alzheimer's compound

The present invention relates to measuring the copy number of a locus by amplifying and comparing test and reference loci. The invention is useful as diagnostic and prognostic tools and in correlating abnormal copy number values for specific loci with disease and effectiveness of different treatment options. The present sequence is a CA repeat fluorogenic probe used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Measuring copy number of a polynucleotide locus in sample useful as diagnostic and prognostic tool, comprises quantifying amount of test locus and reference loci in test and control subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                end attached to 6-carboxy fluorescein"

                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes a novel nucleotide support (A; gene chip) which carries a selection of oligonucleotides (I) that are identical, or complementary, to segments of reference sequences relevant to at least two genetically determined phenotypes. (A) are used for simultaneous diagnosis of at least two of the following diseases: phenylketonuria (maple syrup disease), galactosemia, homocystainuria, blotinidase deficiency, medium-chain acyl-Oachahydrogenase deficiency, familial defective apolipoprotein-B, cystic fibrosis, Marfan syndrome. Smith-Lemil-Opitz syndrome and androgenital. Syndrome are latory familial defective apolipoprotein-B, cystic syndrome specifically they are used in neonatal or prenatal diagnosis. (A) require a relatively small number of separate hybridization regions (about 500 for testing for 21 specified disorders), so can be used for simultaneous testing for many diseases. Testing is quick, inexpensive, reliable and more sensitive than current physiological methods. AAH48868.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ô

This invention describes a novel method for determining the genetic risk of arteriosclerosis both for clinical diagnosis and for population studies. The method comprises: (i) selecting risk-associated reference nucleic acid sequences, including their functionally characterizing complements, to a carrier, (iii) hybridising the probes with a nucleic complements, to a carrier, (iii) hybridising the probes with a nucleic acid from (or synthesised from) a patient sample; and (iv) detecting and evaluating the hybridistion pattern. The method provides a quick, inexpensive and informative diagnosis, and makes possible a intractions or mutations that when present alone carry no risk but are risk mutations or mutations that when present alone carry no risk but are risk associated in presence of other mutations. The results may be combined with known risk-assessment methods to provide a more reliable diagnosis, completed against specific genes. All relevant mutations in a confinct are directed against specific genes. All relevant mutations in a reference sequence can be screened for in a single test and the method is not all interaction. Associated in a single test and the method is interaction and the method is all relevant probes used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; ds; cytochrome P450 Al; CYP4501Al; UGT2B4; MDR1; cytochrome P450 Al; CYP4501A2; cytochrome P450 02E; CYP45002El; LTF; adrenergic receptor betal; ADBR1; aryl hydrocarbon; AHR; MRP3; NR112; aryl hydrocarbon receptor nuclear translocator; ARNT; cathepsin S; CTSS; cyclooxgenase 2; COX2; diazepam binding inhibitor; DBI; haematological; epoxide hydroxylase 2; EPHX2; 5-lipoxygenase activating protein; FLAP; glutathione-S-transferase 12; GST12; histamine-N-methyl transferase;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Determining genetic risk of arteriosclerosis, for clinical diagnosis, comprises hybridizing patient nucleic acid with an array of probes derived from risk-associated reference genes and their mutations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

Isolated nucleic acid molecules having polymorphisms in known human genes e.g. cytochrome p450 and cathepsin S useful as genetic linkage markers for locating, identifying and characterizing the genes responsible for disorder-related traits.

Example 28; Page 159; 714pp; English.

This invention relates to the sequence of an isolated nucleic acid molecule comprising at least one base variation from that of a known human of a known concorned page of a concorned page of a known cytochrome P450 A2 (CTP4501A2), acronded page variation from that of a known nuclear translocator cardy hydrocarbon (ARR), aryl bydrocarbon receptor nuclear translocator (ARRY), cathepsin S (CTSS), cyclooxeganse 2 (CCX2), diazepam binding inhibitor (DBI), epoxide hydroxylase 2 (EPHX2) 5-11poxygenase activating cransferase (HNWT), khallkten 2) KAK2, nicotinamide -N-methyl transferase (HNWT), khallkten 2) KAK2, nicotinamide -N-methyl transferase (HNWT), khallkten 2) KAK2, nicotinamide -N-methyl transferase (HOWT), uvokinase receptor (URD2), UDP-glucuronosyl transferase 2B (UGT2B1), UDP-glucuronosyl transferase 2B (UGT2B1), urokinase receptor (URD2), unlidatury resistance a seociated protein 3 (MRR), cardylam nuclear receptor (RRI12) or actylcholine muscarinic creeptor 1, 2, 3, 4, or 5 (CHRX), CHRX2, CHRX3, CHRX4 or CHRX5) sequence (C (MRP), orphan nuclear receptor (RRI12) or actylcholine muscarinic receptor 1, 2, 3, 4, or 5 (CHRX1, CHRX2, CHRX3, CHRX4 or CHRX5) sequence (C G creptor 1, 2, 3, 4, or 5 (CHRX1, CHRX2, CHRX3, CHRX4 or CHRX5) sequence (C c responsible for specific traits within the genome and eventually crare responsible for specific traits within the genome and eventually corresponsible for specific acid molecules comprising the genes responsible for a variety of disorder-related craft and/or MDR3 are useful for a variety of disorder and and eventually activated and and/or MDR3 and also be used to screen individuals for altered contained in CYPP4501A, CAHK, MDR1 and/or MDR3 may also be used to screen individuals for altered cauchors or altered contained in CYPP4501A, in munological or heematological function, in KHX2 for altered series and contained in CRM3, CHRM2 or precent sequence represents a numeror of h polymorphic DNA sequence of the invention

Sequence 21 BP; 9 A; 0 C; 2 G; 10 T; 0 U; 0 Other;

The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each Vbeta gene, VbetaRNA or cDNA. The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases including autoimmune diseases, degenerative nervous system diseases, and neoplastic disease, hypersensitivity diseases, infectious diseases and neoplastic diseases. Autoimmune diseases include Addison's disease, atrophic gastritis. Degenerative nervous system diseases include multiple sclerosis and Alzheimer's disease. Hypersensitivity diseases include multiple in hypersensitivities such as contact with allergens that lead to

allergies, Type II hypersensitivities such as those present in Goodpasture's syndrome and Type IV hypersensitivities such as those manifested in leprosy. Infectious diseases include viral infections caused by viruses such as HIV, fungal infections such as those caused by

Kit for diagnozing and treating T-cell associated diseases e.g. autoimmune, degenerative nervous system and infectious disease, comprises nucleic acid primers specifically priming and allowing amplification of a

The coding DNA can be used in drug applications, especially to detect a nervous skin syndrome (sic) related antigen
the yeast genus Candida, parasitic infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by Mycobacterium. Neoplastic diseases include lymphoproliferative diseases such as leukaemias, lymphomas and cancers such as cancer of the brain, breast. The present sequence represents a Vbeta gene repeat sequence.

The sequences can be used in the treatment of developmental disturbances and lipid metabolism disease. The present sequence is a PCR primer for the coding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; zinc finger protein 234-72.38; tumour; cytostatic; diabetes; PCR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New polypeptide-human ATP dependent membrane conjugated zinc proteinase 10.45 and polynucleotide for encoding such polypeptide.

nucleic acid target, using a fluorescently labeled probe which produces reduced fluorescence emission when hybridised to the target nucleic acid. The method comprises measuring the reduction in emission caused by hybridisation. The new method is particularly used to quantify target nucleic acids by a real-time polymerase chain reaction, e.g. for quantifying microbial cells in co-cultures or symbiotic system. for detecting gene mutations or polymorphisms, and for analysing melting curves of target nucleic acids to determine a Tm value. Methods of the invention allow target nucleic acids to be quantified quickly, easily and accurately. Particularly there is no need to remove unbound probe, and no materials are introduced that inhibit amplification by Taq polymerase (so conventional PCR conditions can be used). The specificity of PCR is kept
                                                                                                                                                                                                              The present invention relates to human zinc finger protein 234-72.38 (see 8BS59122). The protein can be used for treating diseases such as tumours and diabetes. The present sequence is a PCR primer, which was used in an example from the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Determining the concentration of a target nucleic acid, useful e.g. for detecting genetic mutations, comprises using a fluorescently labeled probe in which emission is reduced by binding to the target nucleic acid.

The invention relates to the determination of the concentration of a nucleic acid target, using a fluorescently labeled probe which produces cauched fluorescence emission when hybridised to the target nucleic acid. The method comprises measuring the reduction in emission caused by the real-time polymerase chain reaction, e.g. for nucleic acids by a real-time polymerase chain reaction, e.g. for analysing microbial cells in co-cultures or symbiotic systems, for detecting gene mutations or polymorphisms, and for analysing melting curves of target nucleic acids to determine a Tm value. Methods of the invention allow target nucleic acids to be quantified quickly, easily and accurately. Particularly there is no need to remove unbound probe, and no materials are introduced that inhibit amplification by Taq polymerase (so conventional PCR conditions can be used). The specificity of PCR is kept high (amplification of primer dimers is delayed), and the limit of quantitation is reduced. Complex probes are not needed, and amplification
                quantitation is reduced. Complex probes are not needed, and amplification can be monitored in real time. The working graph for data analysis dutomatically generated by a computer) has a higher correlation coefficient than conventional graphs so more accurate quantitation is possible. The current sequence represents a synthetic deoxyribooligonucleotide that was used for investigating the base
                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Determining the concentration of a target nucleic acid, useful e.g. for detecting genetic mutations, comprises using a fluorescently labeled probe in which emission is reduced by binding to the target nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Yamada K, Yokomaku T;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention relates to a method for measuring nucleic acids using a nucleic acid probe labelled with a fluorochrome. The nucleic acid probe decreases the fluorescence of the fluorochrome when hybridised with a target nucleic acid, the decrease in the fluorescence is measured. The method can be used for measuring a target nucleic acid
can be monitored in real time. The working graph for data analysis (automatically generated by a computer) has a higher correlation coefficient than conventional graphs so more accurate quantitation is possible. The current sequence represents a synthetic deoxyribooligonucleotide that was used for investigating the base
                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

Measurement of nucleic acids, using a nucleic acid probe and analysis of
the obtained data.
                                                                                                                                                                                                                                                                                                                                                                                                                   This invention relates to a method for measuring nucleic acids using a nucleic acid probe labelled with a fluorochrome. The nucleic acid probe decreases the fluorochrome when hybridised with a target nucleic acid, the decrease in the fluorescence is measured. The method can be used for measuring a target nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Probe; polymorphism detection; mutation detection; disease diagnosis; microbial identification; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to nucleic acid probes, which are useful for assaying nucleic acids by hybridising with a target nucleic acid, in which a single-stranded oligonucleotide is labelled with a fluorescent substance and a quencher in a manner that the fluorescence intensity of the hybridisation reaction system is increased after completion of the hybridisation but no stem loop structure is formed. The probes are useful for assaying nucleic acids and their polymorphism and mutation, particularly useful for e.g. analytical applications, disease diagnosis and microbial identification. The present sequence was used to illustrate
                                                                                                                                                                                                                    Fluorescently-labeled nucleic acid probes for assaying nucleic acids and their polymorphism and mutation, particularly useful in science and medicine for e.g. analytical applications, disease diagnosis and microbial identification.

                                                                                                                                                                                                                                                                                                                                                                   substance and a quencher in a manner that the fluorescence intensity of the hybridisation reaction system is increased after completion of the hybridisation but no stem loop structure is formed. The probes are useful for assaying nucleic acids and their polymorphism and mutation, particularly useful for e.g. analytical applications, disease diagnosis and microbial identification. The present sequence was used to illustrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequences given in AAQ62395-449 are primers which were used in the construction of the vector pVACI. This vector is based on the commercially available vector pRc/RSV. Leader sequences and termination signals were introduced into the vector to allow for production of fusion proteins. The vector, pSfi/Not.Tagl, was modified to replace the pelB leader with the human immunoglobulin VH1 leader sequence that permits the
                                                                                                                                                                                                                                                            The present invention relates to nucleic acid probes, which are useful for assaying nucleic acids by hybridising with a target nucleic acid, in which a single-stranded oligonucleotide is labelled with a fluorescent
Fluorescently-labeled nucleic acid probes for assaying nucleic acids and their polymorphism and mutation, particularly useful in science and medicine for e.g. analytical applications, disease diagnosis and microbial identification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               VH1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Modulating immune response to a disease marker \cdot by administering a vector which expresses the disease marker to interact with the immune

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a method for identifying a genetic marker for spider lamb syndrome (SLS). The method comprising, obtaining a sheep DNA sample, and analysing the sample DNA with a probe to determine the presence or absence of a polymorphism in fibroblast growth factor receptor 3 (FGFR). The invention is used for diagnosing if sheep carry the gene for SLS, used to eliminate carriers of the syndrome from a flock. SLS or hereditary chondrodyplasia is a semi-lefual congenital disorder in sheep causing severe skeletal abnormalities. The present sequence is a 5' PCR-RFLP primer used to detect nucleotide transversion in sheep FGFR3 gene. The FGFR3 gene is located on chromosome 6
          fequence. This fragment was then cloned as an ECORI/Blunt-HindIII fragment into NotI/Blunt- HindIII cut vector pRc/RSV to give pVACI. The single chain Fv for an individual patient can be inserted within the VH1 leader sequence. This plasmid when encoding a single chain murine antibody/retroviral envelope fusion protein can be used as a plasmid vaccine and it induces a strong humoral response to the antibody moiety in BALB/c mice. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Identifying a genetic marker for spider lamb syndrome, used to diagnose if sheep carry a gene for the syndrome, involves analyzing sheep DNA samples for mutations in fibroblast growth factor receptor 3.
encoding of an Sfil cloning site without modification of the amino acid

```

```
sequence for the solute carrier family 6 neurotransmitter transporter, serotonin member 4 (SLC6A4) gene or a fragment of it or a sequence complementary to the first sequence. The invention is used in producing a recombinant organism that can be used to express SLC6A4 for protein structure analysis and binding studies. A composition comprising a genotyping oligonucleotide is used to detect a polymorphism in the SLC6A4
                                                                                                                                                                                                                                                                                                                                                                                       Solute carrier family 6 neurotransmiter transporter; sectonin 4; SLC6A4; genotyping; allele specific oligonucleotide; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated polynucleotide comprising a polymorphic variant for the solute carrier family 6 neurotransmitter transporter, serotonin member 9 gene for identifying drugs for treating disorders related to expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a polymorphic variant of a reference

                         ADO42630;
    The invention relates to amplifying an unknown region that flanks a known region of a cancer-associated DNA sequence comprising providing a template polymucleotide, ligating a loop-forming oligonucleotide to the 3'-end of the sense strand, annealing the loop-forming oligonucleotide with the first portion to generate a panhandle structure, subjecting the panhandle structure control to person of a first primer homologous to the second cortion, where the unknown region is amplified. In the method of cortion, where the unknown region is amplified in the method of comprises a sense strand, comprising the known and unknown region of the known region is comprised a first tor second portion. The first portion is nearer the Unknown region than is the known region. The known collgonucleotide is complementary to the second portion is generated at the first portion is complementary to the second portion is generated at the free end of the comprises APFI (not defined) or BCR (B cell receptor). The method is cueful for amplifying an unknown region that flanks a known region of a cancer-associated DNA sequence. The cancer-associated DNA sequence the chromosomal breaks result in gene fusions with APF-4, CBK-6 and SEPIING and acute myseloid leukaemia, und acute myseloid leukaemia and acute myseloid leukaemia and soute myseloid leukaemia und acute myseloid leukaemia und acute myseloid leukaemi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Amplifying an unknown region that flanks a known region of a cancerassociated DNA sequence by subjecting the panhandle structure to extension and to PCR in the presence of a first primer homologous to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              11q23. The present sequence is a PCR primer used the method of the invention to isolate the unknown region adjacent to the BCR cancer gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a Trypanosoma brucei trypanosome suppressive immunomodulating factor (TSIF) protein. The present invention also describes: (1) the TSIF protein having the primary structural information of amino acids 1-553 of the 833-amino acid sequence of SEQ ID NO:2 (ADP74801) or its fragment or allelic variant having comprising a 1876 base pair sequence of SEQ ID NO:1 (ADP74800) which encodes the TSIF polypeptide, (3) a vector comprising the nucleic acid; (4) a genetically engineered host cell comprising the presence of a frypanostic assay for detecting the presence of a Trypanozoon infection in a mammal. TSIF has immunosupressive activity, and can be used in gene therapy. The TSIF polypeptide or polynucleotide can be used in preparing
preventing a NOVX-associated disorder, e.g., cancer, atherosclerosis, diabetes, Alzheimer's disease, Parkinson's disease, graft-versus-host disease, soleroderma, hypertension, haemophilia, idiopathic thrombocytopenic purpura, immunodeficiencies, AIDS, dyslipidemia, obesity, Crohn's disease, bronchial asthma, anorexia, cancer-associated cachexia, multiple sclerosis or fertility. The nucleic acids may be used as hybridisation probes, in chromosome mapping, in tissue typing, in preventive medicine or in pharmacogenomics. This sequence represents a PCR primer used in analysis of expression of a human NOVX polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New polypeptide derived from Trypanosomes, useful in preparing a medicament for suppressing the immune response in a mammal for treating autoimmune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Trypanosoma brucei; trypanosome suppressive immunomodulating factor; TSIF; immunomodulating activity; Trypanozoon infection; immunosuppressive; gene therapy; immune response; autoimmune disorder;

Fab; rescue; phagemid; PCR; ss.
a medicament for suppressing the immune response in a mammal for treating autoimmune disorders. The present sequence represents a PCR primer for TSIF, which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Two prepns. of PCR-amplified VH genes were made. Both prepns. used an equimolar mixt. of the HUJHFOR primers; in one of the prepns, 6 separate PCR amplifications were performed with each of the HUYHBACK primers individually (1a-6a). The template was CDNA prepd. from RNA obtd. from B lymphocytes, and the prod. was further manipulated to yield the human VH domain. See also AAQ32260-349. (Updated on 25-MAR-2003 to correct PN

The primer was used to amplify the H chain V region from a human monoclonal anti Rh-D cell line Fog-1 (Ig-k). It is one of 6 VH Back monoclonal anti Rh-D cell line Fog-1 (Ig-k). It is one of 6 VH Back (AAQ23700-705) used together with the forward primer HulgG1-4CHIFOR (AAQ23716) for the H chain C region, to prepare a VH-CHI fragment. A corresponding light chain fragment, VK-CK, was prepd. C separately, then the two chains assmbled via a linker sequence to give an Fab construct. The PCR prod. was ligated into the vector, pJM-1-Fab D1.3 (AAQ23857) and the ligation mixt. used to transform E. coll cells. 96 of the resulting clones were screened for anti-Rh-D activity; 40% specifically agglutinated Rh-D positive but not Rh-D negative red blood cells, demonstrating a high frequency of successful splicing in the assembly process and the potential of this technique for one step cloning of human hybridomas. The pri-mers were also used to amplify a VH-CHI fragment to prepare an IgG-lambda monclonal anti-Rh-D Fab from a lymphoblastic cell line (ICL). To determine the diversity of the creating clones, VH and vlambda genes of 15 clones were PCR amplified. 3 different H chain and 2 different light chain families were PCR amplified. 3 clifferent A specific clones were identified out of 96 screened. The VH and Vlambda genes had identical nucleotide sequences in each clone and were typical of anti-Rh-D v-genes. The results demonstrate the potential of the technique to assemble, clone and solated human Ab fragments from the polyclonal cell populations. Sec also AAQ21092-100, 103-116, 126-131;

                                                                                                                                                                                                                                                                                                                                                                        pTK genes were identified using two sets of degenerative oligonucleotide primers: a first set which amplifies all pTK DNA segments (AAQ49743-44), and a second set which amplifies highly conserved sequences present in the catalytic domain of the c-kit subgroup of pTKs (AAQ49745-46). The pTK genes identified are described in AAQ49747-57 and AAR41897-02. (Updated on 25-MAR-2003 to correct PN field.)

The sequence is that of PCR primer HuVHJaBACK which was used, individually or in an equimolar mix of all 6 HuVHBACK primers (AAQ39333-Q39338), in the prepn. of PCR-amplified VH genes. It was used as part of a method of producing chimeric mouse-human antibodies or fragments which have the same binding specificity as a parent Ab but have increased human characteristics, preventing anti-globulin response in humans. (Updated on 25-WAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The primers (AAQ48987-Q49045) are used in the amplification of Kappa and lambda-chain genes of various antibodies. These genes are then recombined into the same replicon, resulting in very diverse libraries of antibody chains, e.g. from unimmunised donors. It is also useful for chain shuffling, mutagenesis, humanishng and CDR imprinting. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A set of degenerate primers (AAT03085-86) designed to amplify all protein tyrosine-kinase (pTK) sequences was used with a second set (AAT03087-88), which amplified highly conserved sequences present in the catalytic domain of the c-kit subgroup of pTKs, in a 2-step PCR to obtain probes used to screen cDNA libraries for the identification of novel pTK genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Agonist antibodies which activate specific protein tyrosine kinase(s) also activate chimeric proteins of kinase extracellular domain and Ig constant domain, useful for studying, and therapeutic modulation of, c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Protein tyrosine-kinase; agonist; cell growth; differentiation; polymerase chain reaction; primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequences given in AAT29175-88 are primers which were used in the method of the invention for the detection of antibody genes which encode antigen specific antibodies. The method comprises activating a lymphocyte with an antigen and synthesizing cDNA from the mRNA contained in the lymphocyte. Heavy and/or light chain coding regions are amplified using primers corresponding to part of the variable region of the immunoglobulin. The cDNA encoding the amplified gene is melted to generate single stranded fragments. The cDNA encoding the antibody of interest is separated from the other cDNA by the difference in single
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Detection and cloning of an antibody gene - using PCR, dissociating the gene into single strands and isolating the gene from a cDNA mixture.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

This invention describes a novel polynucleotide (I) (and complements and hybridizable polynucleotides) comprising a contiguous nucleotide sequence coding for a human antibody with factor VIII specificity which has hemostatic activity. (I) is useful a primer or probe for detecting the presence of inhibitory antibodies directed against factor VIII. The polypeptides of the invention and the antibodies generated from them are useful in compositions for neutralizing factor VIII inhibiting antibodies in hemophilia A patients. ARZ4381-Z4388 represent primers used in the amplification of a human 1gG4 heavy chain which is used in the method of
                                                                                                                                                                                                                                             New polynuclectide, polypeptide and antibody useful for diagnosing the presence of neutralizing antibodies against factor VIII and for treatment of hemophilia A patients with these antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human, serum albumin; HA; antiinflammatory; immunosuppressive; cardiant; nootropic; neuroprotective; gene therapy; immune disorder; wound healing;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes methods of screening a DNA construct binding a transcriptional antibody fusion reagent capable of binding a transcriptional associated biomolecule in vivo. The antibodies are useful in treating Hepatitis A and B respiratory syncitial virus, HIV, Junin virus, Herpes simplex I and II, rubella, cytomegalovirus, Varicella-Zoster virus, Epstein-Barr virus, measles, hantavirus, dengue, Ebola inter alia and cancer. Expression vectors that encode the fusion antibodies may be used in gene therapy. The methods can be used to create and isolate the fusion antibodies. The monoclonal antibody fusion reagent represent specifically claimed PCR primers used in the construction of a human sFv library
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Antibodies from libraries useful in treating viral infections and cancer.
                                                           Human, sFV library, single chain monoclonal antibody fusion reagent, transcription regulation, screening, diagnosis, HIV; Hepatitis A, Hepatitis B respiratory syncitial virus, Junin virus, cytomegalovirus, Herpes simplex virus, rubella; Varicella-Zoster virus, hantavirus, Epstein-Barr virus; measles; dengue; Ebola inter alia; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; IgG4; heavy chain; primer; antibody; factor VIII; hemostatic;

The present invention relates to albumin fusion proteins, which comprise a therapeutic protein and albumin. The albumin fusion proteins are useful in the treatment, prevention, diagnosis, and/or detection of diseases/disorders such as immune system disorders (e.g. transplant rejection), blood related disorders (e.g. myocardial infarction), renal disorders (e.g. childhood acute myeloid leukemia), renal disorders (e.g. childhood acute myeloid leukemia), renal disorders (e.g. childhood acute myeloid disorders (e.g. arrhythmias), respiratory disorders (e.g. non-allergic rhinitis), neurological diseases (e.g. Alzheimer's disease), endocrine disorders (e.g. productive system disorders (e.g. syphilis), infectious diseases (e.g. masteles), gastrointestinal disorders (e.g. intritable bowel syndrome) and wound healing. In the present invention, human serum albumin (HA) see AAMS2567) was used to generate fusion human serum albumin (HA) see AAMS2567) was used to generate fusion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; albumin; HA; immune system disorder; transplant rejection; blood related disorder; myocardial infarction; glomerulonephritis; hyperproliferative disorder; childhood acute myeloid leukaemia; HH; heavy chain variable domain; renal cell carcinoma; antileukaemic; cardiovascular disorder; respiratory disorder; non-allergic rhinitis; pherorological disease; Alzheimer's disease; endocraine disorder; meaales; pheorytochroma; reproductive system disorder; neuroprotective; syphilis; infectious disease; gastrointestinal disorder; neuroprotective; syndrome; HIV; human immunodeficiency virus infection; cytostatic; antiinflammatory; gene therapy; immunosuppressive; cardiant; antiarthritic; antiinflammatory; renal disorder; antimicrobial; vulnerary; arrhythmia; melanoma; PCR primer; 88.
                   Albumin fusion proteins comprising a therapeutic protein and albumin, useful in the treating immune system disorders (e.g. transplant rejection), blood related disorders (e.g. myocardial infarction) and hyperproliferative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                proteins. The present sequence was used to illustrate the invention

```
The invention relates to human albumin (HA) fusion proteins and their corresponding nucleic acid sequences. Therapeutic proteins fused to albumin or its fragments have an extended shelf-life. The albumin fusion proteins are useful in the treatment, prevention, diagnosis, and/or detection of diseases, disorders used as immune system disorders (e.g. transplant rejection), blood related disorders (e.g. childhood acute myeloid infarction), hyperproliferative disorders (e.g. childhood acute myeloid cleuksemia, metastatic renal cell carcinoma), renal disorders (e.g. childhood acute myeloid cleuksemia, metastatic renal cell carcinoma), renal disorders (e.g. cardiovascular disorders (e.g. arrhythmias), crepiratory disorders (e.g. non-allergic rhinitis), neurological diseases (e.g. Alzheimer's disease), endocrine disorders (e.g. pheocytochroma), reproductive system disorders (e.g. sproductive system) albumin fusion protein is used in gene therapy. The present sequence is a PCR primer used to amplify human heavy chain variable domain (VH) gene. Note: The present sequence is incorrectly reffered as compliance in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            neurodegenerative disorders.
                                                                                                                                                                                                                                                                                                                                                               WPI; 2001-488965/53
                                                                                                                                                                                                                                                                                                      Rosen
The invention relates to human G-protein chemokine receptor (CCR5)

CC HOGNRIO polypeptides and polynucleotides. CCR5 HOGNRIO antibodies are

CC useful for treating, preventing or ameliorating a disease or disorder

associated with inflammation, defective or aberrant chemotaxis of immune

CC asrcoma) or defective or aberrant T-cell antigen presenting cell

interaction. The disease or disorder may also be an infections disease

CC cytomegalovirus infection such as an early stage HIV infection, a

CC cytomegalovirus infection, or a poxytrus infection, an autoimmune

CC cytomegalovirus infection, or a poxytrus infection, an autoimmune

CC cytomegalovirus infection, an early stage HIV infection, a

CC cytomegalovirus infection, as poxytrus infection, an autoimmune

CC disease (e.g. rheumatoid arthritis) or a neurodegenerative disorder. The

disease or disorder may be associated with aberrant CCR5 expression, lack

conf CCR5 function, aberrant CCR5 ligand expression, or lack of CCR5 ligand

ct increase or decrease storage capabilities. CCR5 HDGNRIO DNA are useful

CC function. CCR5 HDGNRIO protein is used as a food additive or preservative

ct increase or decrease storage capabilities. CCR5 HDGNRIO DNA,

CT or increase or decrease storage capabilities. CCR5 HDGNRIO DNA,

CT or increase or decrease storage capabilities. CCR5 HDGNRIO DNA,

CT or increase or decrease storage capabilities. CCR5 HDGNRIO DNA,

CT or increase or decrease storage capabilities. CCR5 HDGNRIO DNA,

CT or increase or decrease storage capabilities. CCR5 HDGNRIO DNA,

CT or increase or decrease storage capabilities are also useful in the

diagnosis, treatment and prevention of cancer (breast, ovary, adrenal

CC gland, bone, bone marrow, gastrointestinal tract, luver, lung,

curogenital); immune disorders (Addison's disease, alleries, autoimmune

CC disease, multiple sclerosis, rheumatoid arthritis and ulcerative colities)

CC cardiovascular disorders (Myocadial ischaemala) and wound healing. The

CC creations or UH domain appecifically binds to t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                   Isolated nucleic acid encoding a human G-protein chemokine receptor (CCRS) HDGNR10 polypeptide, useful for preventing or treating autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders and neurodegenerative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

the inventation relaters to immune or procession chemically antibodies are useful for treating, preventing or ameliorating a disease or disorder associated with inflammation, defective or aberrant chemotaxis of immune cells, HIV infection (such as Pneumocystis carinii pneumonia or Kaposi's sarcoma) or defective or aberrant T-cell antigen presenting cell interaction. The disease or disorder may also be an infectious disease (e.g. aviral infection such as nearly stage HIV infection, a cytomegalovirus infection and as nearly stage HIV infection, a disease (e.g. rheumatoid arthritis) or a neurodegenerative disorder. The disease or disorder may be associated with aberrant CRS expression, lack of CCRS function. CCRS HDGNR10 protein is used as a food additive or preservative function: CCRS HDGNR10 protein is used as a food additive or preservative function: CCRS HDGNR10 protein and in gene therapy. CCRS HDGNR10 DNA, cromedatobne, bone marrow, gastrointestinal tract, liver, lung, drenal contents, antibodies, agonists and antagonists are also useful in the disorders (myocardia) immune disorders (Myocardia) is diabetes mellitus, Crohn's curogenital); immune disorders (Myocardia) ischaemias) and wound healing. The cytomegaloviscular disorders (myocardia) ischaemias) and wound healing. The present sequence is a PCR primer used for amplifying human VH domain. The cycle) architical chemokine receptor

where the iraginant of variant has alknown for therapeutic processity.

Abumin fusion proteins are stabilised therapeutic proteins a
Abumin proteins are stabilised therapeutic proteins e.g.

Athumin fusion proteins are stabilised therapeutic proteins e.g.

antidabetic, antirheumatic, antiarthritic and psoriatic activities.

Abumin fusion proteins are stabilised therapeutic proteins e.g.

clistical action, type I diabetes mellitus, rheumatoid arthritis and psoriasis.

Fusing albumin to therapeutic proteins stabilises the therapeutic protein, extends the shelf life and retains the in vitro or in vivo biological activity. It also reduces the need to formulate protein container abuntons with large excesses of carrier proteins to prevent loss of therapeutic proteins due to factors such as binding to the container. The fusion proteins are easily dispensed with a simple formulation requiring minimal post storage manipulation. The fusion of therapeutic proteins to albumin confers stability in aqueous or other solution. The present sequence represents a PCR primer which is used in an example from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes an albumin fusion protein (I) comprising a therapeutic protein: X and (a fragment or variant of) albumin comprising a the fully defined sequence in ABB79006 of 585 amino acids, (where the fragment or variant has albumin or therapeutic protein: X
                                                                                                                                                                                                                                                                                                                                                                                           New albumin fusion proteins, useful for treating diseases and disorders such as cancer, comprise therapeutic protein fused to albumin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gabs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Vascular endothelial growth factor; VEGF; antisense; angiogenesis; cell proliferation; Kaposi's sarcoma; cancer; melanoma; cytostatic; antisense therapy; RT-FCR; primer; VEGFR-1; ss.

                                                                                                                                                                                                                                                                                                                                              The invention provides a composition comprising one or more antisense oligonucleotides directed against vascular endothelial growth factor (VEGF) Where the antisense oligonucleotides inhibits profileration of between 0.5-2.5 micro Ma. The antisense oligonucleotides and IC 5.0 concentration of against VEGF for inhibiting cancer cell proliferation and angiogenesis. Preferably the oligonucleotide AAM23032 (a modified version of AAM22984) is used and may be utilized to treat Kaposis sarcoma, ovarian cancer, prostrate cancer, pancreatic cancer or melanoma. Sequences AAM33012-023 represent gene-specific primers used in RT-PCR amplification of VEGF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                               Novel antisense oligonucleotides useful for inhibiting vascular endothelial growth factor expression, angiogenesis and for treating cancer, e.g., Kaposi's sarcoma, ovarian cancer and prostrate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       .

The present invention relates to the isolation of a novel human G-protein chemokine receptor (CCR5) designated HDGNR10, and polynucleotide sequences encoding it. The invention also describes antibodies that bind human G-protein chemokine receptor (CCR5) HDGNR10 and polynucleotide chemokine receptor (CCR5) HDGNR10 and polynucleotide sequences encoding the antibodies. The antibodies are useful for treating or preventing inflammation, defective or aberrant chemotaxis of immune cells and T-cell/antipunpantion, defective or aberrant chemotaxis of immune cells and T-cell/antipunpantion and autoimmune diseases, rheumatoid arthritis, neurodegeneration, viral infections (especially early-stage human immune deficiency virus (HIV), cytomegalovirus or pox virus infections, Raposi sarcoma, or conditions associated with aberrant or deficient expression of the CCR5 expression, cits ligands. The antibodies are also useful to determine CCR5 expression, cits ligands. The antibodies are also useful to determine CCR5 expression, cits ligands. The antibodies are also useful to determine CCR5 expression, cits ligands in the antibodies are also useful to determine CCR5 expression, cG-protein chemokine receptor (CCR5) HDGNR10 can be used to produce the recombinant receptor, and in the treatment of a wide range of diseases (e.g. parkinson's disease), and hyperproliferative disorders (e.g. cancer). ABK51871-ABK51906 represent PCR primers used to amplify VH and VL domains
                                                                                                                                                                                                     New nucleic acid encoding an antibody specific for the G-protein chemokine receptor CCR5, useful for treatment and diagnosis of e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             the examples of the present invention

metalloprotease (MP-1). (I) is useful for preventing, treating, or metalloprotease (MP-1). (I) is useful for preventing, treating, or ameliorating a medical condition, particularly an immune disorder, an aberrant glutamate transport or motor neuron disorder, such as amyotrophic lateral sclerosis (ALS), its juvenile form or an ALS-like amyotrophic lateral sclerosis (ALS), its juvenile form or an ALS-like condition. The compositions and methods are also useful for diagnosing, prognosticating, treating, ameliorating and/or treating disorders associated with MP-1 activity, e.g. diabetes, cancer, reproductive disorders (e.g. Klainfelter's syndrome, genital warts, or germinal cell aplasia), metabolic disorders (e.g. premature puberty, Kallman syndrome, or Cushing's syndrome), neurodegenerative diseases (Alzheimer's disease, Huntington's disease or Tourette syndrome), liver and renal diseases and immune disorders (e.g. AIDS, rheumatoid arthritis or sepsis), pulmonary diseases (e.g. pneumonia, emphysema or cystic fibrosis) and vascular, inflammatory and neurological disorders (e.g. Alzheimer's disease or Parkinson's disease). This sequence represents a primer associated with the novel human metalloprotease MPI polynucleotide New isolated nucleic acid encoding MP-1 protein, useful for preventing, treating, or ameliorating diseases associated with aberrant metalloproteinase activity, e.g. immune, metabolic, inflammatory and neurological disorders. The invention describes an isolated nucleic acid molecule (I) encoding Gaps ö Score 17.2; DB 1; Length 23; Pred.                                                                                                                                         specifically bind to a polypeptide and, oligonucleotides that comprise a sequence that encodes a preselected polypeptide to which the agents bind. The anti-tag capture agents such as antibodies are used as tools for sorting proteins containing polypeptide tags for which the capture agents are specific and for a process of nested sorting. The agents are useful for functional surveys of large diversity libraries such as gene libraries. The present sequence is a PCR primer used to amplify human antibody heavy chain variable region (VH) gene. This primer is used in

The present invention describes a human G protein coupled receptor (GPCR), designated HGPRBMY27 (I). (I) has antiinflammatory, antiinfertility, pulmonary, cytostatic, nephrotropic, hormonal and circulatory activities, and can be used in gene therapy. (I) or the protein encoded by it can be used to prevent, treat, or ameliorate a medical condition, such as inflammatory disorders, reproductive disorders, pulmonary disorders, cancer, renal disorders, connective tissue disorders, endocrine disorders, or disorders involving aberrations in tubular tissues. They can also be used to diagnose a pathological condition or a susceptibility to (I). The protein can be used to screen for candidate compounds capable of modulating activity of a GPCR polypeptide. The present sequence represents a PCR primer for the VH domain of an antibody against human HGPRBMY27, which is used in an antibody against human HGPRBMY27, which is used in an
                                                                                                                                                               New polynuclectide encoding a human G-protein coupled receptor for preventing, treating, or ameliorating e.g. an inflammatory, reproductive, pulmonary, renal connective tissue, or endocrine disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 23 BP; 3 A; 3 C; 12 G; 5 T; 0 U; 0 Other;

```
The invention relates to an isolated polynucleotide encoding a potassium channel beta subunit (K+betaM6) polypeptide or its variants. The human dotassium beta subunit polynucleotide or polypeptide is useful for diagnosing, preventing, treating or ameliorating a pathological condition such as gastrointestinal, reproductive, neural, sleep, cardiovascular or activity, an immuned disorder related to hyperpotessium channel strivity, an immuned disorder related to aberrant NFB activity, pineal gland associated disorder migraine headaches, disorders associated with aberrant melatonin synthesis and/or release or with low DNA repair capacities or low free-radical buffering capacity, delayed sleep phase syndrome, aberrations in circadian cycle, mammary cancer tumourigenesis, age related disorders associated with decreased melatonin secretion, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cancer. This polynucleotide sequence represents a PCR primer relating to the potassium channel beta subunit (K+betaM6) of the invention
                                  polypeptide, useful for diagnosing, preventing, treating or ameliorating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Albumin fusion protein; therapeutic protein X; human albumin; HA; human serum albumin; HSA; cancer; reproductive disorder; diagestive disorder; immune disorder; endocrine disorder; haematopoietic disorder; neural disorder; connective disorder; cytostatic; antiinfertility; antiinflammatory; antiulcer; immunomodulator; anti-HIV; antiinflammatory; antiulcer; ineuroporotective; antiparkinsonian; antimicrobial; neuroleptic; osteopathic; antiarthritic; VH domain; PCR; primer; ss.
   New polynucleotide encoding human potassium channel beta subunit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ouery Match 0.5%; Score 17.2; DB 1; Length 23; Best Local Similarity 86.4%; Pred. The present invention relates to albumin fusion proteins comprising a therageutic protein X and human albumin (HA, also known as human serum albumin, HSA). The proteins are useful for treating a disease or disorder that may be modulated by therageutic protein X. The albumin extends the schifts of protein X, and may increase its biological in vitro/in vivo activity. The protein Is useful for treating and diagnosing disorders such as cancer, reproductive disorders, digestive disorders (e.g. Crohn's disease, ulcerative colitis), immune disorders (e.g. acquired immunodeficiency syndrome, AIDS), endocrine disorders (e.g. diabetes), haemacropoietic disorders, neural disorders (e.g. Alzheimer's, schizophremia), and connective disorders (e.g. osteoporosis, arthritis). ABK93295-ABK93304 represent PCK primers used to amplify DNA encoding human antibody VH domains in the examples of the present invention
                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; G-protein chemokine receptor; CCR5; HDGNR10 protein; cancer; inflammation; viral infection; autoimmune disease; neurodegeneration; rheumatoid arthritis; Pneumocystis carinii infection; Kaposi's sarcoma; hyperproliferative disease; heavy chain variable domain; PCR; primer; VH;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to human G-protein chemokine receptor (CCRS), HDGNR10 proteins and nucleic acid molecules encoding such proteins. CCR5 antibodies are used for the treatment or prevention of inflammation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New nucleic acid encoding antibodies to the human CCR5 receptor HDGNR10, useful for treatment, prevention and diagnosis of e.g. cancer, also related antibodies.
                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human HDGNR10 antibody VH domain amplifying PCR primer, Hu VH3-5'.

defective or aberrant chemotaxis of immune cells or T cell antigen-
presenting cell interaction, viral infections (specifically human immune
deficiency (including its early stages), cytomegalo or pox viruses),
autoimmune disease, rheumatoid arthritis, neurodegeneration, Pneumocystis
carinii infection, Kaposi's sarcoma or any condition associated with
aberrant expression of CCR5 or their ligands. They are also used for the
detection, diagnosis, prognosis and monitoring of cancers or other
hyperproliferative diseases. The present sequence is a PCR primer used to
amplify human HDGNR10 antibody heavy chain variable (VH) domain

New potassium channel beta-subunit, K+betaM2, proteins and nucleic acids, useful for diagnosing, treating and/or preventing e.g. reproductive, neural, metabolic, endocrine, memory, neurodegenerative disorders or

Example 19; Page 358; 366pp; English.

diseases.

The present invention relates to human potassium channel beta-subunit (K+betaM2) proteins and polynucleotides encoding such proteins. The FebrerM2 sequences are useful for diagnosing, treating and/or preventing reproductive disorders, neural disorders, disorders related to aberrant potassium regulation or hyper potassium channel activity, metabolic

```
disorders (e.g. premature puberty), endocrine disorders (e.g. aberxant growth hormone synthesis and/or secretion), memory disorder, disorders of the testis (e.g. spermatogenesis), neuroendocrine condition related to aberrant thyroid hormone release, renal disease or disorders (e.g. capturints), disorders related to aberrant higher brain function (e.g. nephritis), disorders related to aberrant higher brain function (e.g. learning deficiencies), neurodegenerative diseases (e.g. Alzheimer's disease), prolliferative disorders (e.g. carcinoid tumour) and disorders (involving excessive smooth muscle tone or excitability (e.g. asthma).

They may be used to modulate haemostatic or thrombolytic activity, to treat or prevent blood coagulation diseases or disorders, blood platelet diseases, wounds, autoimmune diseases, disorders or conditions (e.g. rhemmatoid arthritis), allergic reactions (e.g. asthma), organ rejection or graft-versus-host disease, and hyperproliferative diseases. K+betaM2 or graft-versus also used in gene therapy. The present DNA sequence is a givented against human k+betaM2 DNA. This sequence is used in the

New isolated nucleic acid molecules encoding human glycine receptor A4 (HGRA4) polypeptides, useful for preventing, treating and ameliorating conditions, e.g. neural or gastrointestinal disorders.

Example 24; Page 341; 349pp; English.

The present invention provides the protein and coding sequences of the human glycine receptor alpha 4 (HGRA4) and its splice variant HGRA4sv. The sequences can be used in the treatment of neural disorders, gastrointestinal disorders, disorders related to hyper glycine receptor

The antibodies are useful for preparing a composition for the treatment of cancer, and for imaging tumours associated with activated stromal fibroblasts, such as colorectal cancer, non-small-cell lung cancer, breast cancer, head and neck cancer, ovarian cancer, lung cancer, bladder cancer and metastatic brain cancer, lung cancer, bladder associated with the same, such as inflammation and wound healing. The present sequence is a PCR primer described in the exemplification of the
activity, cardiovascular disorders, reproductive disorders, or bacterial, viral and parasitic infections. The present sequence is a PCR primer used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New human humanized antibody that specifically binds to fibroblasts activating protein alpha, useful for treating cancer or tumor, and for imaging tumors associated with activated stromal fibroblasts, e.g. lung or breast cancer.
                                                                                                                                                 Gaps

```

```
The present invention relates to a human or humanised antibody (Ab) which specifically binds to fibroblast activating protein alpha (FAPalpha). The antibodies are useful for preparing a composition for the treatment of cancer, and for imaging tumours associated with activated stronal fibroblasts, such as colorectal cancer, non-small-cell lung cancer, breast cancer, head and neck cancer, non-small-cell lung cancer, bladder cancer, pancreatic cancer and metastatic brain cancer, and diseases associated with the same, such as inflammation and wound healing. The present sequence is a PCR primer described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New human humanized antibody that specifically binds to fibroblasts activating protein alpha, useful for treating cancer or tumor, and for imaging tumors associated with activated stromal fibroblasts, e.g. lung

Nephrotropic; Antiinflammatory; Cytostatic; Gene Therapy; human; VH; PCR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        K+berant and K+berans, CDNA sequences (I, ADJ33294 and ADJ33316), and senceded proteins sequences (II, ADJ33295 and ADJ33317). The invention is useful for preventing, treating or ameliorating a medical condition by administering (I) or (II) to a mammalian subject, where the medical condition is a disorder related to hyper potassium channel activity selected from a hepatic, neural, gastrointestinal, reproductive, immune, cardiovascular or renal disorder, or an immune disorder related to aberrant apoptosis or innate immunity, an infectious disease, an inflammatory disorder and cancer. The present sequence is a primer used in an example from the invention for amplifying VH domains, for k+betam6 proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to human potassium channel beta subunits,
                                 hyper potassium channel activity; hepatic disorder; neural disorder; gastrointestinal disorder; reproductive disorder; immune disorder; cardiovascular disorder; renal disorder; immune disorder; apoptosis;

This invention relates to an isolated nucleic acid molecule comprising a polynucleotide encoding a human G-protein receptor, including HGRBMY28, CC HGRBMY29, HGRBMY29, GDTPGENENY29/2 POLYPEPTIGES. THE HGRBMY28 OF HGRBMY29 polypeptides and nucleic acids are useful for treating, preventing or ameliorating a medical condition, e.g. an immune disorder, an inflammatory disorder, an inflammatory disorder, an inflammatory disorder, an inflammatory disorder, a neural disorder, a pastrointestinal disorder, a disorder a pulmonary coupled receptors are either disorder, a disorder a pulmonary coupled receptors are either disorder, a disorder a disorder related to aberrant p27 regulation, a disorder related to aberrant bNA repair regulation, a disorder related to aberrant DNA repair regulation, a disorder related to aberrant call cycle regulation, a disorder related to aberrant capptosis regulation, a disorder in disorder of the spleen, a disorder of the lymph capptosis regulation, a disorder of the spleen, a disorder of the injuder, a male or female reproductive disorder; an oesophageal disorder, a metabolic disorder, an endocrine disorder, a proliferative disorder afflicting the colon, cervix, lung, squamous cells or tissues, a renal disorder, a cardiovascular disorder, a placental disorder, and a disorder of the spleen, extense of the chestes, heart or lymph modes. The isolated polymucleotides of the invention may be used to treat disorders by gene therapy. This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

Novel antibody against TNF-related apoptosis inducing ligand, useful for preventing, treating and ameliorating cancers and other hyperproliferative disorders, binds immunospecifically to TRAIL receptor polypeptide.

Example 5; Page 325; 405pp; English.

tumour necrosis factor (TRP)-related approximatory. This coult is a composed to the invention are useful for treating, preventing or ameliorating cancer (e.g. cancers of pancreas, uterine, breast, colon, lung and gastrointestine and Kaposi's sarcoma's and other hyperproliferative disorders, neurodegenerative disorders (e.g. neurodegenerative disorders (e.g. neurodegenerative disorders (e.g. lupus, rheumatoid arthritis, multiple sclerosis, myasthenia gravis, Hashimoto's disease and immunodeficiency syndrome; AIDS, herpes viral infections and other viral rheumatoid arthritis), infections diseases (e.g. acquired immune deficiency syndrome; AIDS, herpes viral infections and other viral confections), myelodysplastic syndromes (e.g. applastic anamia), graft-versus-host disease, ischaemic injury, liver injury, toxin-induced liver disease, septic shock, cachexia, anorexia and proliferative disorders. Antibodies of the invention are also useful for treating cardiovascular disorders associated with neovascularisation, speciasis, and ulcerative colitis and for wound healing. The invention is also used to prepare vaccines. The present sequence is a PCR primer used to amplify human antibody VH domain. This primer is used in the exemplification of The invention relates to antibodies that immunospecifically bind to the inventior

New isolated polynucleotide encoding an antibody which inhibits vascular endothelial growth factor (VEGF)-2 polypeptide, useful for diagnosing or treating diseases associated with aberrant VEGF-2 expression or function, e.g. cancer.

Example 32; Page 236; 344pp; English.

This invention describes a novel isolated polynuclectide encoding a first antibody comprising an amino acid sequence selected from at least one, two or three complementarity determining (CDR) region(s) of a VH and/or UL domain of a second antibody that immunospecifically binds to a vacular endothelial growth factor (VEGF)-2 polypeptide. The products of the invention have cytostatic, cardiovascular, antibheumatic, vulnerary, antiparamentory, antiarthritic, antidiabetic, ophthalmological, cardiant, antiallergic, immunosuppressive, dermatological and antipostiatic activity. The polynucleotide is useful in diagnosing, treating, preventing, prognosing, wellocating or monitoring diseases associated with aberrant VEGF-2 receptor expression or lack of VEGF-2 or VEGF-2 receptor function, such as cancer and other proliferative disorders (e.g. cerebral anoxia), inflammatory diseases, cerebrovascular disorders (e.g. cerebral anoxia), inflammatory diseases, infectious diseases, autoimmune diseases (e.g. rheumatoid arthritis, systemic Lupus Erythematosus, allergies), diabetic retinopathy or psoriasis. The polynucleotide, polypeptide and antibodies described in the invention may also be used to stimulate angiogenesis, wound healing, may also be used for in vitro purposes related to scientific research, synthesis of DNA and manufacture of DNA vectors and from the diagnostics and therapeutics e.g. gene therapy and in vaccines to treat human diseases. This sequence represents a PCR primer used in the isolation and amplification of polynucleotides described in the disclosure of the invention.

```
The invention relates to an isolated antibody comprising a first amino acid sequence having 95 % identity to a second amino acid sequence of either variable heavy chain or light chain-complementarity determining regions (VHCDR1)/VLCDR1, VHCDR2/VLCDR2 or VHCDR3/VLCDR3 appearing as ABG71906-ABG71911 being specific for human TRAIL receptors 1-4 (TNF (tumour necrosis factor) related apoptosis-inducing ligand receptor, also known as TR4, TR5, TR7 and TR10). Also included are an isolated cell that produces the antibody, an antibody that binds the same epitope on a TR4 polyapetide or detecting, diagnosing, prognosing or monitoring cancers, and other hyperproliferative disorders using the antibodies, a hybridoma cell line selected from the hybridoma cell line selected from the hybridoma cell lines selected from the hybridoma cell lines sontained in C ATCC Deposit No. PFA-3149, PFA-2687, PFA-3730, PFA-2739, PFA-2729, PFA-2729, PFA-2729, PFA-2731, PFA-2730, PFA-2729, PFA-2729, PFA-2731, APA-2731, APA-2731, APA-2731, PFA-2731, PFA-2732, PFA-2731, PFA-2732, PFA-2731, PFA-2732, PFA-2733, PFA-2733, PFA-2733, PFA-2733, PFA-2733, PFA-2733, PFA-2732, PFA-2733, PFA-

Byfurome (altob), on neurougenerative usolute (e.g., national, e.g., e.g., inflammatory diseases such as rhematoid arthritis, and psoriais, cardiovascular diseases, in promoting angiogenesis, wound healing, and in regulating immune response. Many other diseases and disorders are listed in the specification. The antibody is administered in combination with a chemotherapeutic agent selected from irinotecan, paclitaxel (TAXOL (RTW), and gencitabine. The antibody is useful as a diagnostic tool to monitor the expression of TRAIL receptor expression on cells, to detect, purify, and target the polypeptides, and in immunoassays for qualitatively and quantitatively measuring levels of TRAIL receptor polypeptides. The present sequence is a PCR primer used to amplify a nuclaic acid encoding the heavy chain variable region of an anti-TRAIL receptor antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

New isolated nucleic acid molecule for diagnosing, treating or preventing disorders, e.g. neuro- and musculo-degenerative conditions or cancer, related to the CAN-12 or CAN-12v2 polypeptides.

Example 35; Page 454; 737pp; English.

The invention relates to an isolated nucleic acid molecule comprising a polynucleotide having a sequence that is at least 95% identical to the human cDNAs for CAN-12 or its variants (CAN-12v1 and CAN12v2), including various functional fragments defined in the specification CAN-12 is a calpain family cysteine processe, the gene for which is located on chromosome 2p16-p21. Also included are the encoded CAN-12 proteins (including fragments), CAN-12 recombinant vectors, host cells, anti-CAN-

a molecule or a molecule complex which comprises the structural coordinates of CAN-12 and CAN-12v2 models given in the specification, a method for identifying a mutant with altered biological properties, function or activity of CAN-12 and CAN-12v2 models given in the specification, a method for identifying a mutant with altered biological properties, function or activity of CAN-12 and CAN-12v2 and a method for designing or selecting compounds as potential modulators of CAN-12 and CAN-12v2. The nucleic acid molecule and the polypeptide are useful in diagnosing, treating and/or preventing various diseases and disorders related to the CAN-12 or CAN-12v2 polypeptides, particularly neuro- and musculo- degenerative conditions, such as cancer, multiple sclerosis, blood disorders, autoimmune disorders, oesophagitis or other ossophagaal motility disorders. Many other diseases and disorders are listed in the specification. The methods may be used in identifying agonists and antagonists of the above polypeptide and polynucleotide. The present sequence is a PCR primer used to clone DNAs encoding the VH and VL (heavy and light chain variable regions) molecules of anti_CAN-12 antibodies

WPI; 2003-290187/28.

New human potassium channel beta subunit (K+betaWB) polypeptide or polymucleotide, useful for preventing, treating or ameliorating e.g. breast or colon cancer, arthritis, asthma, multiple sclerosis, ostecarthritis or ischemia.

Example 32; Page 284; 308pp; English.

The present sequence is PCR primer Hu VH3-5', which is designed to amplify human antibody heavy chain variable regions (VH). It is one of a set of primers (see ACC48651-86) used in the identification and cloning of VH and VL domains of antibodies directed against the novel human

```
companies can be used to generate expression vectors. Antibodies directed to KabetaMB are useful for affinity purification of the polypeptide, in diagnostic assays and imaging, in immunophenotyping, and in therapeutic applications, including the use of nucleic acids encoding the antibodies in antibody-based gene therapy. Disorders that may be treated include a male reproductive disorder, a testicular disorder, testicular cancer, a neural disorder, a disorder related to aberrant calcium, potassium or potassium channel regulation, a pullmonary disorder, an immune system disorder associated with mis-regulation of NPKB, an inflammatory disorder, an innate immunity disorder, a disorder associated with a failure to initiate and/or sustain an adequate inflammatory response, in the antibody and an antibody and an antibody and an antibody and an adequate inflammatory response, an innate immunity disorder, and innate                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cell mediated autoimmune disease, or psoriasis

```
The present invention relates to novel antibodies that immunospecifically bind to TRAIL receptor (TR4). Sequences of the invention are useful for treating, preventing or amediorating cancer (e.g. colon, breast, uterine, pancreatic, lung, gastrointestinal or central nervous system cancer e.g. medulloblastoma, neuroblastoma, glioblastoma and Kaposi's sarcoma) in human. They are useful for detecting expression of TR4 polypeptide and detecting, diagnosing, prognosing or monitoring cancers and other hypercentation, diagnosing, prognosing or monitoring cancers and other hypercentating preventing or amediorating neurodespeneration are useful for treating, preventing or amediorating or monitoring cancers and other hypercentating preventing or amediorating or monitoring acancers (e.g. upons) prognosing or monitoring acancers and other hypercenting progneting or amediorating or anthiotopic lateral sclerosis, retinitis pigmentosa, cerebellar degeneration and Huntington's disease, retinitis pigmentosa, cerebellar degeneration and Huntington's disease, colymyositis, immune-related glomerulonephritis, monitorin's disease, polymyositis, immune-related glomerulonephritis, myasthenia sclarosis, inflammatory circlositis and immune deficiency syndrome (AlbS), infectious diseases (e.g. acquired immunodeficiency syndrome). Infections and other viral infections and other viral infections and cardiovascular diseases (such as that caused by stroke, anorexia and toxin-induced liver diseases (such as alcohol). They are also useful for treating cardiovascular diseases or disorders and contar diseases such as limb ischemmia, diseases or disorders and cardiovascular tuberculosis, diseases or disorders and cardiovascular tuberculosis, diseases or disorders and contaring and sequence is human TR4 antibody the propertion or recovery from s

The invention relates to a nucleic acid molecule, or its complement, that encodes an anti-placele binding protein, isolated from a phage display encodes an anti-placele binding protein, isolated from a phage display concodes an anti-placele thing protein, isolated from a phage display of library by an in vitro selection process that comprises screening at class one human anti-play variable domain expression library against at class one human placelet antigen, and the human antibody variable domain expression library expresses single-chain proteins. Also included are an expression library expresses a single-chain proteins. Also included are an expression overcor comprising the week of an on-human mammal. Comprising the cells producing the anti-platelet binding protein encoded by the mucleic acid that binds to a placelet aggregation or thrombus formation), a substantially isolated and purified human antibody (or its fragment) that binds to a placelet binding protein, and a conjugate comprising a non-confident antigenic polywer covalently linked to the single-chain antigen-binding site of the anti-platelet binding protein, and a conjugate comprising and antigenic polywer covalently linked to the single-chain antigen-binding protein are useful for inhibiting platelet aggregation or platelet midding protein are useful for whole the blood vessel having an endothenial linking in need of treatment. The cottor, the host cell, the anti-platelet binding protein or platelet midding protein or platelet midding protein or platelet midding protein or platelet midding protein or sector sector of whose cell, the anti-platelet binding protein or platelet midding protein or platelet midding protein or sector. The host cell, the anti-platelet binding protein or the only are encodery preventing or treating conditions such as venous for conjugate of encodery preventing or treating thromboembolism, unstable angina, saphenous vain bypass graffs, valvular heart disease, cerebrowageular disease, secondary prevent conjugates of medical d Novel nucleic acid molecule encoding anti-platelet binding protein which is useful for inhibiting platelet aggregation or platelet mediated thrombus formation in blood and for treating venous thromboembolism. Example 1; Page 17; 30pp; English 29-FEB-2000; 2000US-0185628P. WPI; 2003-554858/52. FILP/) FILPULA D R.

The antibody or its fragment immunospecifically binds TRAIL (tumour necrosis factor; TNF-related apoptosis-inducing ligand) receptor 7 (TR7). TR7 is also referred to as TRAIL receptor 2 (TRAIL-R2), death receptor 5 (DR5) and KILLER. The antibody or its fragment is useful for treating, preventing or amellorating a cancer, e.g. colon, breast, uterine, pancreatic, lung or agastrointestinal cancer or Kaposi's sarcome or cancer of the central nervous system such as medulloblastomm, neuroblastomm or glioblastomm or graft versus host disease, AIDS (acquired immune deficiency syndrome) or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antibody or its fragment, useful for treating, preventing or ameliorating a cancer, e.g. colon, breast, uterine, pancreatic, lung or gastrointestinal cancer, or Kaposi's sarcoma or, graft versus host
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   therapy. ```
The invention describes an isolated nucleic acid molecule comprising a sequence that is at least 95% identical to a polymoclectide encoding novel human G-protein coupled receptor HGPRBMY25. The nucleic acid molecule, polypeptide and antibody are useful in diagnosing, preventing, treating or ameliorating medical conditions where GPCR is directly or andirectly involved, such as immune or inflammatory diseases (e.g. arthritis, asthma, AIDS, graft-versus-host disease, psoriasis or systemic lupus erythematosus), reproductive disorders (e.g. varioccele or cribits), neural disorders (e.g. Alzheinmer's disease, Parkinson's disease, depression or schizophrenia), cardiovascular disorders (e.g. hypertension or acute heart failure), pulmonary disorders, endocrine disorders (e.g. obseity, diabetes or anorezial, bone disorders (e.g. osteoporosis), pain or cancer. The polymucleotide may also be used in identification, in identifying organisms from minute
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acid molecule encoding a human G-protein coupled receptor (HGPRBMY25) is useful for diagnosing, preventing or treating diseases involving the receptor, e.g. inflammation, diabetes, asthma, hypertension
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  biological samples, or as molecular weight markers. This sequence represents a primer used to isolate DNA encoding human variable heavy (VH) chain domains of anti-HGPRBMY25-antibodies
                                                                                                                                                                                                                                                                                                                                                                  Mintier GA;

New human G-protein coupled receptor HGPRBMY26 polypeptides and nucleic acids, useful for preventing, treating or ameliorating e.g. testicular disorder, choriocarcinoma, infertility, viral orchitis, or Cushing's

Example 35; Page 106; 149pp; English.

syndrome

```
The invention relates to an isolated nucleic acid molecule encoding a G protein-coupled receptor HGPRBWY26. The nuclectide sequence comprises sequential nuclectide deletions from either the C-terminus or the N-terminus. Also included are an isolated polypeptide encoded by the crecombinant host call comprising the nucleic acid, making a crecombinant host call comprising the nucleic acid, making a pathological condition or a susceptibility to a pathological condition in testicular tissue of a subject, identifying a compound that modulates the bological activity of a human G-protein coupled receptor HGPRBMY26 (and a member consisting of NPAT/GRE or NPAT G alpha 15, all undefined), and creening for candidate compounds capable of modulating activity of the HGPRBMY26 polypetide. The HGPRBMY26 polypetides, polypeutides, polypeutides, compounds or pharmaceutical preparations comprising HGPRBMY26 are useful for preventing, treating or ameliorating a male reproductive condition; can amine disorder or a condition where G-protein coupled receptors are (in) directly involved in disease progression, a testicular disorder, testicular cancer, choriocarcinoma, nonseminoma, seminoma,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

The invention relates to G-protein coupled receptor (GPCR), HGPRBMY14 and its corresponding nucleic acid sequence. HGPRBMY14 sequences are useful for preventing or treating a disorder directly linked to aberrant neuropeptide Y receptor activity or to aberrant DNA synthesis, an eating or appetite disorder, male reproductive disorder or proliferative disorder, andle reproductive disorder or proliferative disorder e.g., testicular cancer. These are useful for detecting a susceptibility to) a pathological condition. HGPRBMY14 is useful for

Example 30; Page 111; 166pp; English.

ö
identifying its binding partners, including agonists and antagonists. Antagonists to the polypeptide is useful in treating a disorder related to aberrant NF-NB activity or a proliferative disorder. HOPRBMY14 DNA and protein are also useful in treating neurodegenerative or autoimmune disorders, or diabetes mellitus. The present sequence is a RT-PCR primer used for amplifying human HGPRBMY14 antibody VH gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a human chemokine betal (Ckbl) protein (I) comprising a deletion in amino acid residues from the amino terminus and/or carboxy terminus of the 31 residue amino acid sequence (S1, see ADD06466). (I) has anti-HIV, neuroprotective, antithyroid, antiarthritic, antirheumatic, immunosuppressive, nootropic, antiinflammatory, antiathatic, antiallergic, osteophymic, nephrotrophic, tuberculostatic, virucide, antiatheroselerotic and antimicrobial activities. (I) is useful

for preventing infection, preferably viral (human immunodeficiency virus (HIV)) infection, in a cell, by contacting the cell with (I). (I) is also useful for treating a disease, such as HIV infection or immune disorders, haematopoietic disorders, autoimmune disorders, multiple sclerosis, carve's disease, arthritis, rheumatoid arthritis, transplant rejection, grave's disease, arthritis, transplant rejection, asthma, allergic disorders, inflammatory bowel disease, osteoarthritis, collitis, inflammatory kidney diseases, glomerulonephritis, inflammatory disease, disease, tuberculosis, hepatitis inflammatory disease, userulosis, hepatitis inflammatory disease, cultammatory disease, userulosis, hepatitis infections, broliferative disorders or aberosclerosis, in an individual. (I) inhibits or abolishes the ability of HIV to bind to, viral infection, proliferative disorders or arberosclerosis, in an individual. (I) inhibits or abolishes the ability of HIV to bind to, viral also acts a CCRS agonists or antagonists, stimulate chemotaxis of CCRS-expressing cells, inhibit CCRS igand binding to a CCRS expressing cells, inhibit CCRS igand binding to a CCRS expressing colls, inhibit CCRS igand binding to a CCRS expressing cells, inhibit CCRS igand binding to a CCRS expressing cells, inhibit CCRS expression. (I) is useful as an immunological probe for the differential identification of the tissues or cell-types. (I)-human serum albumin (HSA) fusion proceins are useful for disquesing and preventing various disorders in mammals, cell-types. (I)-human serum albumin (HSA) fusion proceins are useful for electrophoresis techniques, for raising antibodies, and to test the electrophoresis techniques, for raising antibodies, and to test the biological activities of the CKbl protein. (I)-HSA fusion protein portein portein custing for molecules that bind to the CKbl protein portein custing for molecules that bind to the CKbl protein portein portein custing for molecules that bind to the CKbl protein in the contein contein custing for mol

The present invention relates to novel proteins and their coding sequences (ADC83405) encoding human transient receptor potential sequences (ADC83400-ADC83405) encoding human transient receptor potential channels. The coding sequences are useful for preparing a medicament for preventing, treating or ameliorating a medical condition, such as renal disorders; a disorder related to abbarrant calcium regulation; neural disorders various choroid plexus neoplasms; prion disorder; cerebellum disorders, various choroid plexus neoplasms; prion disorders; movement disorders; a disorder that maps to or is misoriated with chromosome locus 9q21.11-21.31; amyotropic lateral calcionasis early onset pulverulent cataract; infantlle nephronophthisis; hypomagnesemia with secondary hypocalcemia; osteoporosis; DNA-repair deficiencies; xeroderma pigmentosum; UV sensitivity; gamma irridation sensitivity; pyrimidine dimer sensitivity; chemical mutagenesis; Bloom's conceased levels of apurinic/Apyrimidine/Abasic sites; disorders related to aberrant signal transduction; and disorders related to misregulation con the content of the content 
                                                                                                                                                           userul in preventing, treating or ameliorating a medical condition, such as renal disorder, neural disorder e.g., Alzheimer's disease, or cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Albumin fusion protein; therapeutic protein; HIV; osteoporosis; cancer;
                                                                                                                               New human transient receptor potential channel (LTRPC3) nucleic acid,

The present invention relates to albumin fusion proteins comprising any of the therapeutic proteins listed in the specification, or their fragments or variants, and an albumin protein or its fragments or variants. The invention also discloses pharmaceutical compositions comprising the albumin fusion proteins, a kit comprising the albumin fusion proteins, and methods for treating a disease or disorder in a patient, that is modulated by the therapeutic protein or its fragment ovariant. The compositions and methods of the invention are useful in variant. The compositions and methods of the invention are useful in such as HIV, osteoporosis, cancer, wounds, autoimmune diseases or disorders, cardiovascular diseases, hepatitis, multiple sclerosis, psoriasis, graftversus-host diseases, stroke, atherosclerosis and inflammation. New combination comprising an addressable collection of binding sites, software comprising instructions for pattern recognition and an imager for detecting patterns, useful for profiling a sample.

```
The present invention describes a combination of apparatus (1)

comprising: (a) an addressable collection of binding sites; and (b)

software comprising instructions for pattern recognition and/or an imager

for detecting patterns. The addressable collection of binding sites

comprises: (a) capture agents, where each capture agent is preselected to

specifically bind to a pre-selected tags; and (b) tagged reagents, each

comprises a molecule and etags; where each locus in the

collection comprises the same capture agent, where the tagged reagent

comprises a molecule and a tag, each tag is pre-selected to specifically

bind to a capture agent, where each tag is bound to a capture agent,

comprises a molecule and a tag, each tag is bound to a capture agent,

comprises a molecule and a tag, each tag is bound to a capture agent,

comprises a molecule and a tag, each tag is bound to a capture agent,

comprises the ranged reagent with the capture agent, where

comprises a sample; (1) a system for profiling samples; (2) a method for profiling

comprising a capture system or computer readable medium comprising

the database produced by the method of profiling a sample; (4) a method

for preparing a capture system that displays a collection of binding

comprising capture agents bound to a solid support and tagged reagents;

and (6) a method for screening samples. The combination (1) is useful for

of the dramation.

The invention is useful for producing three-dimensional representation of a molecule or molecular complex comprising the structural coordinates of the PAS domain of HEAG2. The invention is also useful for treating conditions such as disorder associated with aberrant amygdala function, fear, neurodevelopmental psychopathological disorders, softizophrenia, autism, aggression, memory, enotional disorders, aberrant hypothalamus function, leptin receptor disorders, food intake disorders, energy-expenditure disorders, bone camodeling disease, appetite suppression and motion sickness. The present sequence is PCR primer used to amplify human HEAG2 VH domain. This sequence is used in the exemplification of

antibody (ABI) comprising an amino acid sequence of at least one, two or three complementarity determining regions (CDR) of a heavy chain variable (VH) domain of an antibody (AB2) that immunospecifically binds to a protein chemokine receptor (CCRS), at least one, two or three CDR regions of a light chain varaible (VL) domain of AB2 or at least one, two or three CDR regions of both a VH and a VL domain of AB2. The antibody is useful for detecting, diagnosing, prognosing or monitoring cancers and other hyperproliferative disorders and for treating, preventing or
                                                                                                                                                                                                                                                                                                                                                                                                                                                             New polypeptide comprising domains of an antibody that binds G-protein chemokine receptor CCRS is useful to detect, diagnose, prognose or monitor cancers and other hyperproliferative disorders and to treat or prevent a disease or disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ameliorating a disease or disorder. This sequence represents a primer used in the isolation of an immunoglobulin heavy chain variable region from antibodies of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention describes a new isolated polynucleotide that encodes an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0.5%; Score 17.2; DB 1; Length 23; 36.4%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention relates to a novel albumin fusion protein having albumin or biological activity. Human serum albumin is responsible for a significant proportion of the osmotic pressure of serum and also functions as a carrier of endogenous and exogenous ligands. The fusion of albumin to a therapeutic protein may increase shelf-life and stability of the therapeutic protein. The albumin fusion protein of the invention may allow production of compositions with antidiabetic activity whilst the nucleotide sequence which encodes it may be useful for gene therapy. The albumin fusion protein is useful for preparing a composition for treating diabetes mellitus. The present sequence is that of a PCR primer which was used in the exemplification of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New albumin fusion protein, useful for preparing a composition for treating diabetes mellitus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention relates to novel DNA sequences encoding protease-42

Equally and the calpain superfamily. Calpains have been associated with numerous disease states. The invention may allow development of compounds with hepatotropic, pardiant, ophthalmological, antinflammatory, cardiant, ophthalmological, antinflammatory, activities. The sequences provided may be useful for gene therapy or development of a vaccine. The nucleic acids may be useful for preparing a composition for diagnosing, preventing, treating or ameliorating a composition for diagnosing, preventing, treating or ameliorating a composition for diagnosing, preventing, treating or ameliorating a disorder related to aberrant calpain activity, a disorder associated with deficiencies in calpain activity, a disorder associated with Mypercalpain activity, a disorder associated with Mypercalpain activity, a disorder related to aberrant calcium regulation, privice tract disorders, infertility, carcinomas of the female reproductive tract disorders, infertility, carcinomas cuterine bleeding dysfunction, pelvic aromatase deficiency, premature cuterine bleeding dysfunction, pelvic aromatase deficiency premature companse, placental dysfunction, pelvic aromatase deficiency placens, calpains, either directly or indirectly, are involved in disease to memopause, either directly or indirectly, are involved in disease calpains, either directly or indirectly, are involved in disease calpains, either directly or indirectly, are involved in disease calpains, either directly or indirectly, are involved in disease colon or gastrointestinal tissue, colon clon or gastrointestinal tissue, colon colon or gastrointestinal related to adenocarcinoma, ischaemia-reperfusion injury, hearing disorders, mailtiple sclerosis, cataracts or myocarditis.
                                                                                                                                                                                                                                                                                                                                                                                       New nucleic acid encoding a human cysteine protease, useful for preparing
                                                                                                                                                                                                                                                                                                                                                                                                               a composition for diagnosing, preventing or treating e.g., neural, hepatic, immune, hematopoietic, renal or pulmonary disorders.
                                                                                                                                                                                                                                                                                     Nayeem A, Nelson TC;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 23 BP; 3 A; 3 C; 12 G; 5 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence is that of PCR primer Hu VH3-5' for the human heavy chain variable region (VH). A set of primer sequences ADF18233-ADF18268 was used in the identification and cloning of VH and VL domains from antibody-expressing cell lines. The invention relates to antibodies that specifically bind to TL5. These are used in the diagnosis, prevention or rreatment of a disease or disorder such as an autoimmune disease, retamnent of a disease or disorder such as an autoimmune disease, transplant rejection, cancer (especially colon cancer, breast cancer, userine cancer, parceatic cancer, lung cancer, gastrointestinal cancer, and Kaposi's sarcoma), an immunodeficiency syndrome, or an inflammatory disease such as asthma or allergy.
                                                                                                                                                                                                                                                                                                                                                              New antibody that specifically bind to TLS, useful for diagnosing, preventing, treating or ameliorating diseases (e.g. cancer, autoimmune disease, inflammation or transplant rejection), and in immunophenotyping
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      TR2; orphan nuclear receptor; cytostatic; immunosuppressive; virucide; immunostimulant; dermatological; antiinflammatory; antirheumatic; antiathritic; neuroprotective; muscular; antiasthmatic; antiallergic;

```
The invention relates to an isolated antibody (A1) that specifically binds orphan nuclear receptor TR2 or that competitively inhibits the binding of an antibody to TR2. The antibody and methods are useful in inhibiting the growth of or Killing orphan nuclear receptor TR2 expressing cells and treating, preventing or ameliorating a disease or disorder selected from an autoimmune disease, graft-versus-host disease, transplant rejection, cancer, herpes simplex virus infection and an immunodeficiency, e.g. lupus erythematous, rheumatoid arthritis, multiple solatosis, mysathenia gravis, or inflammatory discorders (e.g. asthma or allergies). The antibody may also be used in immunoassays for qualitatively and quantitatively measuring levels of TR2 polypeptides in biological samples, in immunophenotyphing of cells lines and biological samples, or in epicope mapping. Sequences ACFS8401-436 represent PCR primers for amplifying the VM and VL domains of an anti-TR2 antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antibodies that specifically bind to orphan nuclear receptor useful for diagnosing, preventing, treating or ameliorating diseases, e.g. cancer, autoimmune diseases, inflammation or viral infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                GMAD; VH; CDR; complementarity determining region; VL; scFv; single chain antibody; antidiabetic; type II diabetes; human; PCR;

The invention describes a new isolated nucleic acid molecule comprising:

a polynucleotide fragment or complement of the cDNA sequence;
by sequence; a polynucleotide fragment of the cDNA sequence; a

polynucleotide sequence comprising nucleotides 4-1404 or 1-1404 of the

1404-by sequence; or a polynucleotide sequence encoding a polypeptide, or

1404-by sequence; or a polynucleotide sequence encoding a polypeptide, or

1404-by sequence or comprising nucleotides sequence dees not

1404-by sequence; or a polynucleotide sequence encoding a polypeptide

1504-by sequence or comprising nucleotide sequence, or its

1505-by sequence or nucleotide sequence having only A or I residues. The

1505-by peptide comprises a fully defined 335-amino acid sequence, or its

1505-by sequence. The nucleic acid is useful for preparing a composition

1506-by sequence or its acid is acid is an enclorating a medical or

1507-by sequence or its acid is acid is a medical or

1508-by sequence or its acid is a disorder associated with deficiencies in

1509-by sequence or its accorder associated with deficiencies in

1509-by sequence or its accorder associated with deficiencies in

1509-by sequence or its accorder associated with hypermethionine activity,

1509-by sequence related to aberrant protease regulation, a disorder related to

1509-by sequence or its accorder accorders, metabolic disorders,

1509-by sequence or its accorder accorders, metabolic disorders,

1509-by sequence or its accorder accorders, an inflammancer or its accorder                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel polynucleotide useful for detecting single nucleotide polymorphisms
                                  New nucleic acid encoding a human methionine aminopeptidase, useful for preparing a composition for diagnosing, preventing or treating e.g., neural, metabolic, vascular, immune or inflammatory disorders or ovarian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                variable domain of antibodies directed against novel human methionine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  human; single nucleotide polymorphism; microarray; side effect; ss;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                The invention relates to a novel antibody that specifically binds to a GMAD polypeptide comprising a first amino acid sequence that is at least 95% identical to a second amino acid sequence of a VH CDR (complementarity determining region) or VL CDR of an scPv (single chain antibody molecule). The antibody of the invention demonstrates antidiabetic activity and may be useful for diagnosing, monitoring, treating, preventing or ameliorating type II diabetes. The current sequence is that of the PCR primer which was used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Naglich J;

```
This invention relates to a novel DNA sequence encoding a human growth factor with homology to epidermal growth factor-8 (BGS-8). The invention may be useful for the development of compounds with an immunosuppressive, haemostatic, gynaecological, antiinfertility, hepatotropic, cardiant or cytostatic activity which act as BGF agonists. In addition the genetic equences of the invention may be useful for gene therapy. The invention may be useful for preventing, treating or ameliorating medical conditions, such as immune disorder, haematopoietic disorder, a hepatic disorder, a male or female reproductive disorder, a hepatic disorder, a cardiovascular disorder, a proliferative disorder, cancer, or a disorder related to aberrant growth factor regulation, wound repair, a disorder related to aberrant growth factor regulation, wound repair, or regulation of the BGF receptor, or a proliferative condition involving one or more lymph node, uterus, liver, heart, stomach, lung and pancreas.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Fusion protein; human serum albumin; HSA; therapeutic protein; shelf-life; in vitro biological activity; in vivo biological activity; metabolic disorder; endocrine disorder; diabetes; type 1; type 2; diabetes-related condition; hyperglycaemia; neural disorder; neuropathy; extinopathy; cardiovascular disorder; heart diseases; renal disorder; obesity; glucose level maintenance; weight loss; antidiabetic; cardiant; anorectic; ophthalmological; gene therapy; antibody; VH domain; PCR;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        굄
                                                 The invention relates to a novel polymucleotide isolated and purified from a human gene having any one of 935 fully defined sequences as given in specification, or a sequence having a base substitution. The invention further relates to: an oligonucleotide containing single mucleotide polymorphisms; a PCR primer set chosen from the combination of two DNA fragments from any one of 1200 fully defined sequences as given in convention; a labelling probe containing the SNP containing oligo; and a microarray equipped with the SNP containing oligo. The isolated human a microarray equipped with the SNP containing oligo. The isolated human contains in human gene. The isolated human gene is also useful for detecting the single mucleotide colymorphisms in human gene is also effective in detecting single mucleotide polymorphism in a human gene. This polymucleotide sequence represents one of the PCR primers used in the single nucleotide polymorphism one of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The invention relates to fusion proteins comprising human serum albumin and therapeutic polypeptide such as a therapeutic protein, antibody or peptide or their variants or fragments. The therapeutic protein protein may be fused to the N-terminus, the C-terminus or both termin of albumin via a linker. The albumin component of the fusion proteins or prological activity of the proteins compared with those of the corresponding thesapeutic proteins on their own. The invention also relates to nucleic acids the proteins on their own. The invention also relates to nucleic acids albumin fusion protein, vectors and host cells comprising an albumin fusion protein, the method of extending the shelf-life of a lusing an albumin fusion protein with albumin fusion protein mucleic acid, compositions and kits comprising an albumin fusion protein with albumin fusion proteins may be used in the treatment of metabolic/endocrine disorders, diabetes and diabetes. The albumin fusion proteins may be used to treat type 1 and type 2 diabetes, hyperglycaemia, neural disorders (especially heart disease, renal disorders and obseity. The proteins may also be used in a method of maintaining a basal glucose level in a patient and in a method for losing weight. The present sequence is related to the invention. New albumin fusion protein, useful for preparing a composition for Example 91; SEQ ID NO 344; 1086pp; English. treating diabetes mellitus. WPI; 2003-598501/56

Bol

New TRP-PLIK2 nucleic acid and its splice variants, useful for manufacturing a medicament for preventing, treating or ameliorating a medical condition, e.g. renal, inflammatory or reproductive disorders.

Example 33; SEQ ID NO 274; 457pp; English.

This invention relates to a novel isolated human TRP-PILK2 (transient receptor potential channel) nucleic acid sequence and the protein encoded by it. The invention may be useful for the development of compounds with an antiinflammatory, gramecological, immunomodulatory, cardiant, cytostatic, neuroprotective, antiviral or anti-HIV activity. In addition, the DNA sequence may be useful for gene therapy. The invention may therefore be useful for manufacturing a medical condition, for preventing, contexting or ameliorating a medical condition, for example immune cisorders, hepstucks, hepstuck disorders, repair in a disorders, renal disorders, reproductive disorders, hepstuck disorders, negorders, respirate cancer, consistent cancer, diseases related to chromosome. 9q21.2-22 aberrations, testicular cancer, diseases related to chromosome. 9q21.2-22 aberrations, amyotrophic lateral scalerosis with frontotemporal dementia, early-onset curveruphic ataract, infantile nephronophthisis, hypomagnesaemia with secondary hypocalcaemia familial hemophagocytic lymphohistiocytosis, neuron degeneration, neurogenic inflammation, allergy, conset immunodeficiency/excessive immune activation, visual defects, hearing ciscorder, pain, cancer, hypertension, cardiovascular diseases, diseases associated with disturbances in Calcium homeostasis including costeoporosis, hypercalciuric stone disease, chronic renal failure, immuno-compromised conditions, HIV infection, disorders associated with aberrant compromised conditions, HIV infection, disorders associated with aberrant caperiation, disorders in which decreasing of increasing NF-kappa-B activity would be therapeutically desirable and disorders in which activity would be therapeutically desirable and disorders in which activity would be therapeutically desirable and disorders in which activity would be therapeutically desirable.

                                                                                                                                                                                Rosen CA,
```

The invention relates to an isolated polynuclectide encoding a first antibody at least 95-100% identical to a second antibody comprising an amino acid sequence selected from at least on, two or three CDR region(s) of a VH or VL domain where the first antibody immunospecifically inhibits a VBGF-2 polypeptide. The isolated polynucleotide.is useful in diagnosing, preventing, preventing, prognosing, ameliorating or monitoring diseases associated with aberrant VBGF-2 or VBGF-2 receptor expression or lack of VBGF-2 or VBGF-2 receptor function, such as cancer and other proliferative disorders (e.g. cerebral anoxia), inflammatory diseases, infectious diseases, autoimmune diseases anoxia), inflammatory diseases, infectious diseases, alteringises), diabetic retinopathy or psoriants. The polynucleotide, polypeptide and antibodies may also be used to stimulate angiogenesis, wound healing, and promoting vascular tissue repair. The polynucleotide and polypeptide may also be used for in vitro purposes related to scientific research, synthesis of DNA and manufacture of DNA vectors, and for the production of diagnostics and therapeutics to treat human diseases. This polynucleotide sequence represents a PCR primer used in the exemplification of the invention

Novel NF-kappaB-associated polypeptides and polynucleotides useful for diagnosing, treating and preventing cancer, hepatic disorders, aberrant apoptosis, viral infections, autoimmune disorders, asthma and stroke.

Example 33; Page 407; 608pp; English.

The present invention relates to the isolation of human nuclear factorkappaB (NP-kappaB) associated polypeptides and polynucleotides. The NFkappaB associated polypeptide and polynucleotide sequences are useful for
preventing, treating or ameliorating various disorders including immune
disorders, inflammatory disorders, cancers, disorders relating to
aberrant apoptosis, hepatic disorders, Hodgkin's lymphomas,
hematopoietic tumours, hyper-IgM syndromes, hypohidrotic ectodermal
dysplasia, X-linked anhidrotic ectodermal dysplasia, immunodeficiency, al
immunodeficiency virus (HIV), human T-cell lymphotropic virus (HTLV),
hepatitis B, hepatitis C, Epstein Barr virus (EBN), influenza),
rheumatoid arthritis, inflammatory bowel disease, colitis, asthma,
cheumatoid arthritis, antharmatory bowel disease, colitis, asthma,
altergic encephalomyelitis (EAB), autoimmune disorders related
to hyper immune activity, disorders related to aberrant acute phase
cesponses, hypersongenital conditions, birth defects, necrotic lesions,
wounds, organ transplant rejection, disorders related to aberrant signal
centerior of the panorease encourage encourages encoura disorders (e.g. Huntington's chorea), Turner's syndrome, bacterial infections, cardiovascular disorders, infertility, psoriasis and haemolytic anaemia. The present sequence represents a PCR primer used in the examples of the present invention

```
The present invention relates to the isolation of a novel member of the immunoglobulin (Ig) superfamily, human antigen presenting cell expression (APEXX4, and variants (APEXX401) thereof.

The polypeptides of the invention are useful for treating, preventing or ameliorating medical conditions, such as immunological disorders (e.g. rheumatoid arthritis, inflammatory bowel disease, sepsis, acne or hostversus grateful disease, sepsis, acne or hostversust leukocyte proliferation, differentiation, migration or activation, disorders related to aberrant activation of disorders related to aberrant activation of natural killer cells, disorders of the spleen, inflammatory disorders, and proliferative disorders (e.g. neoplasms). APEX4, APEX41 and APEX41 polypeptides, and polymucleotides encoding them are useful for modulating proliferation, dispration and activation in various cells, tissues and conferentiation, migration and activation in various cells, themanone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New APEX (antigen presenting cell expression) 4 and APEX4v1 proteins and nucleic acids, useful for treating or preventing e.g. immunological disorders, hematopoeitic and/or proliferative diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         organisms. The polynucleotides sequences are are useful in chromosome identification, chromosome mapping, as molecular weight markers, and if gene therapy. The present sequence represents a PCR primer used in the examples of the present invention
                                                                                                                                                                                                                                                  PCR primer #3 for DNA encoding VH domain of anti-APEX4 human antibody.

The invention comprises the amino acid and coding sequence of B7-related (BSL2) fusion proteins. The B7-related fusion proteins of the invention are useful for modulating the activation of immune or inflammatory response cells (e.g. T cells). The B7-related fusion proteins are useful for treating or preventing: transplantation rejection, graft versus host disease; asthma; chronic obstructive pulmonary disease; cancers; viral infections (e.g. HIV, herpes or encephalitis); and autoimmune disease (e.g. rheumatoid arthritis, multiple sclerosis or psoriasis). The present DNA sequence represents a PCR primer that was used to amplify the DNA encoding the variable domain of an antibody that is specific for a B7-

The invention relates to an albumin fusion protein comprising a
therapeutic protein:X, and albumin, its variant or fragment. The albumin
there fusion protein has the formula R1-L-R2, R2-L-R1, or R1-L-R2-L-R1 where R1
therapeutic protein:X or fragment, Lis a peptide linker and R2 is
albumin. The albumin fusion protein is useful for treating a disease or
disorder that is modulated by therapeutic protein:X (claimed), such as
cancer; infections (bacterial, viral, fungal, parashito); or immune
CC (AIDS, asthma); hematopoietic (leukemia, sepsis); reproductive (cystic
fibrosis, endometriosis); musculoskeletal (osteoporosis, osteoarthritis);
cardiovascular (congestive heart failure, alterosolerosis); neural/
candiovascular (congestive heart failure, alterosolerosis); neural/
censory (ataxia, attention deficit disorders, autism); respiratory
dispative (ulcer, cirrhosis); or connective/epithelial (lupus, keloids)
disorders. Sequences ACC78589-634 represent PCR primers for amplifying
human VH and VL domains, that can be used to create multifusion proteins
                                                                        Albumin, HA; cytostatic; antibacterial; virucide; fungicide; anti-HIV; antiasthmatic; osteopathic; antiarthritic; antiinflammatory; nootropic; neuroprotective; anti-thyroid; anti-ulcer; hepatotropic; vulnerary; protein therapy; growth hormone; hGH; VL; VH; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antisense; ss; PCR; VEGF; vascular endothelial growth factor; human; cancer; angiogenesis; neoplastic proliferation; primer; RT-PCR; reverse transcriptase PCR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New albumin fusion protein comprising a therapeutic protein:X, and albumin, its variant or fragment, useful for treating a cancer, AIDS asthma, leukemia, sepsis, endometriosis, osteoporosis, atherosclerosis, autism, or emphysema.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0.5%; Score 17.2; DB 1; Length 23; 36.4%; Pred. The invention relates to a composition comprising an antisense oligomucleotide directed against vascular endothelial growth factor (VEGF). The antisense oligomucleotide is useful for preparing a composition treating cancer, neoplastic proliferation, abnormal cellular proliferation and preventing angiogenesis. The present sequence is a proliferation and preventing angiogenesis. The present sequence is a carearse transcriptase (RT)-PCR primer for a VEGF or related gene, used to clone the coding region for expression in tumour cell lines. The cell lines were used to test prospective antisense oligonucleotides
                                                                                                                                                                                                                                                                                                                                            New composition comprising an antisense oligonucleotide directed against vascular endothelial growth factor, useful for preparing a composition

Homo sapiens.

```
The invention relates to. an isolated nucleic acid encoding a human G-
protein coupled receptor HGPRBMY39 (or its fragment domain or epitope),

tis complement or a polynucledide capable of hybridising under stringent

conditions to it. Also included are a HGPRBMY39 recombinant vector, a

conditions to it. Also included are a HGPRBMY39 recombinant vector, a

recombinant host cell comprising the vector sequences (used to express

and make the protein), an isolated HGPRBMY39 polypeptide, and an anti-
HGPRBMY39 antibody. The HGPRBMY39 polypeptide, and an anti-
HGPRBMY39 antibody. The HGPRBMY39 polypeptide is

useful for preventing, treating or ameliorating e.g. a (male)

creproductive disorder; a testicular disorder or cancer; a disorder related to aberrant G-

protein coupled receptor dependent phosphatidylinositol-calcium

creproductive adisorder related to aberrant G-

protein coupled receptor dependent phosphatidylinositol or calcium second messenger activation; an inflammatory disorder; a developmental disorder; a

clasorder that would benefit from inhibition of a leukotriene B4-dependent

creproduction; a disorder associated with below normal neutrophil activation; a disorder associated with below normal neutrophil activation;

activation; a disorder associated to aberrant superoxide generation;

coxidation states; a disorder related to aberrant neutrophil activation;

coxidation states; a disorder related to aberrant neutrophil activation;

coxidation states; a disorder related to aberrant meutrophil activation;

coxidation states; a disorder related to aberrant superoxide generation;

coxidation states; a disorder related to aberrant neutrophil activation;

coxidation states; a disorder related to aberrant superoxide generation;

coxidation states; a disorder related to aberrant meutrophil activation;

coxidation states; a disorder related to aberrant superoxide generation;

coxidation states; a disorder related to aberrant superoxide generation;

coxidation states; a disorder activation;

coxidation states
                                                                                                                                                                                                              New human G-protein coupled receptor, HGPRBMY39, useful for treating or preventing e.g. immune, inflammatory, developmental, proliferative, neural, reproductive, bone marrow or prion disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 23 BP; 3 A; 3 C; 12 G; 5 T; 0 U; 0 Other;

(BRIM) BRISTOL-MYERS SQUIBB CO. 19-JUL-2001; 2001US-0306577P. 19-JUL-2002; 2002WO-US023407. Feder J, Lee L, Chang H; WPI; 2003-577292/54. WO2003050235-A2. 19-JUN-2003

New isolated human potassium channel alpha subunit, KalphaM2 polypeptide, useful for diagnosing, preventing, treating or ameliorating a medical condition, for example a neural disorder, an immune disorder or a metabolic disorder.

Example 31; SEQ ID NO 43; 313pp; English.

The invention relates to an isolated human potassium channel alpha
subunit, K+alphaMZ polypeptide. The K+alphaMZ polypeptide and
subunit, K+alphaMZ polypeptide. The K+alphaMZ polypeptide and
colymucleotide are useful for diagnosing, preventing, treating or
ameliorating a medical condition, such as a neural disorder, an immune
disorder (e.g. rheumatoid arthritis, AIDS, asthma, leukemia, psoriasis or
centropenia), a disorder related to aberrant potassium regulation,
metabolic disorder (e.g. diabetes, pancreatitis, osteoporosis or
hypertriglyceridemia), a reproductive disorder, a renal disorder, a male
creproductive disorder (e.g. infertility, testicular cancer or viral
orchitis), a memory disorder, an obsersative/compulsive disorder, an
addiction, a disorder related to aberrant dopamine or serotonin
regulation, depression, irritability, anxiety, or depression,
irritability or anxiety associated with treating drug addiction, learning
irritability or anxiety associated with treating drug addiction,
irritability or price the affective disorders. Antibodies against
the polypeptides from recombinant cell culture, in diagnostic assays to
detect the presence or quantification of the polypeptides, or for
immunophenotyping. Vectors and host cells containing the gene are useful
containing the polypeptides. This sequence corresponds
corrections and host cells containing the gene are useful to a PCR primer to amplify a heavy chain variabl human potassium channel K+alphaM2 antibody gene.

```
The invention relates to an isolated human G-protein coupled receptor, HGPRBMY30 polypeptide or a sequence having 95% identity to the above mentioned sequences. (I) is useful for preventing or treating a medical condition, selected from an immune disporder; a cardiovascular disorder; an inflammatory disorder in which G-protein coupled receptors are either disorder; a reproductive disorder; a metabolic disorder; a neural disorder; an endocrine disorder; a metabolic disorder; a neural disorder; an endocrine disorder; cesticular cancer; a neural disorder; an endocrine disorder; an entabolic gastrointestinal disorder; an endocrine disorder; cesticular cancer; an eneral disorder; an endocrine disorder; castoming, preventing, treating, and/or ameliorating the diseases such as hematopoietic and pulmonary disorders, Alzheimer's Parkinson's diseases, diabetes, dwarfism, color blindness, retinal pigmentosa, as hematopoietic and pulmonary disorders, Alzheimer's, Parkinson's diseases, diabetes, dwarfism, color blindness, retinal pigmentosa, stress, renal failure, acute heart failure, hypotension, obesity, stress, renal failure, acute heart failure, hypotension, obesity, anorexia, HIV infections, osteoporosis, angina pectoris, and myocardial infarction. (I) and (II) are useful for modulating signal transduction activity; (I) and (II) are useful for modulating signal transduction of food additive or preservative, and for modifying the activities of (I).

(I) and (II) also useful to modulate mammalian characteristics, such as body height, weight, hair color, eye color, skin, percentage of adipose tissue, pigmentation, size and shape, to change a mammal's mental state or physical state by influencing biorhythms, caricadic rhythms, capabilities, hormonal or endocrine levels, appetite, libido, memory, stress, or other cognitive qualities. This sequence corresponds to a preservative or physical state by an endocrine levels appetite, libido, memory, proper, and proper an antibody targeted to the novel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel human G-protein coupled receptor, HGPRBMY30 polypeptide useful for preventing and treating e.g. immune disorders, cardiovascular disorders

New antibody that specifically binds to a chemokine beta-4 polypeptide, useful for diagnosing, treating, preventing or ameliorating psoriasis, rheumatoid arthritis, systemic lupus erythematosus, cancer, HIV infection WPI; 2004-022614/02. and wounds

Example 2; SEQ ID NO 39; 181pp; English.

The present invention describes an antibody (I) that specifically binds to a chemokine beta-4 (CK-B4) polypeptide. Where (I) comprises a first to a chemokine beta-4 (CK-B4) polypeptide. Where (I) comprises a first camino acid sequence at least 95% identical to a second amino acid acid comprising a VH complementarity determining region (CDR) or VL CDR of any of the single chain Fvs (scFvs) from any of 17 fully defined sequences of 245-253 amino acids (ADEB3861 to ADEB3877). Also described: (I) a kit comprising the isolated nucleic acid of (2); (4) a host coll comprising the vector of (3); (5) a cell line engineered to express (I); (3) a vector comprising the isolated nucleic acid of (2); (4) a host cell comprising the vector of (3); (5) a cell line engineered to express (I); (6) an antibody that binds the same epitope as (I); (7) an antibody that competitively inhibits the binding (I) to a CK-B4 polypeptide; (8) a method for detecting aberrant expression of CK-B4 polypeptide; (7) and comparing the same pitope as (I); and comparing the camper of CK-B4 polypeptide expression or level of CK-B4 polypeptide expression or level of CK-B4 polypeptide expression or level of CK-B4 collogical sample with a second, normal biological sample, where an increase or decrease in the assayed level of CK-B4 polypeptide in the first of a blological sample comparing to the standard level in the first of a blological sample comparing to the standard level in the companion of the standard level of CK-B4 polypeptide companion or level of CK-B4 plolypeptide companion or level of CK-B4 plolypeptide companion or level of che standard level of CK-B4 polypeptide companion or level of CK-B4 plolypeptide companion or level of CK-B4 plolypetide companion or level of CK-B4 plolypetide companion or level aberrant expression, and (9) a method of treating, preventing or amellorating pooriasis, dermatitis or an autoimmune disease, comprising administering (1) to the animal. (1) has antipsoriatic, dermatological, antiinflammatory, immunosuppressive, antirheumatic, antiarthitic, cerebroprotective, cytostatic, anti-HIV and vulnerary activities. The methods and compositions of the present invention are useful for diagnosing, treating, preventing or ameliorating psoriasis, dermatitis or an autoimmune disease such as rheumatoid arthritis, systemic lupus erythematous and autoimmune encephalitis. They can also be used in cancer, HIV infection, wounds and inflammatory disorders. The present sequence is used in the exemplification of the present invention.

Ruben SM,

```
The invention comprises a DNA sequence encoding an antibody which immunospecifically inhibits vascular endothelial growth factor 2 (VEGF-2) protein. The antibody of the invention is useful for detecting, diagnosing, monitoring, treating or preventing cancers or other hyperproliferative disorders, inflammatory disorders, autoimmune disease, rheumatoid arthritis, psoriasis, and diabetic retinopathy. The present DNA sequence represents a PCR primer that was used in an example of the
                                                                                                                                                                                                                                                                                                                                                                  New polynucleotide encoding VEGF-2 antibody, useful in detecting, diagnosing, prognosing, monitoring, treating or preventing e.g. cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                         Example 32; SEQ ID NO 38; 410pp; English

Isolated nucleic acid molecule for e.g. diagnosing and treating cardiovascular condition, comprises polynucleotide encoding human leucine-rich repeat cardiac receptor-1 protein having amino acid sequence of Mintier G; 11-OCT-2001; 2001US-0328478P. Feder JN, Ramanathan CS, (FEDE/) FEDER J N. (RAMA/) RAMANATHAN C S. WPI; 2004-031999/03. MINTIER G. specific length. (RAMA/) (MINT/)

Example 34; SEQ ID NO 55; 164pp; English.

The invention relates to an isolated nucleic acid molecule comprises a polynucleotide encoding the full-length human leucine-rich repeat cardiac receptor-1 (HLLRCH-1) protein appearing as ADG75441and ADG75443. Also included are a recombinant vector comprising the isolated nucleic acid molecule, a recombinant vector comprising the vector sequences, the isolated polypeptide, an isolated antibody that binds condition in the isolated polypeptide, making an isolated polypeptide, and recovering the polypeptide, making an isolated polypeptide or specifically to the isolated polypeptide, making an isolated polypeptide or disolated polypeptide, and recovering the polypeptide, diagnosing a pathological condition or a susceptibility to a pathological condition in a subject (by determining the presence or absence of a mutation in the polymericoride, and diagnosing a pathological condition or a subsence of the mutation) and preventing, treating or ameliorating a medical condition by administering a polypeptide or its modulator to a manmalian subject. The HLLRCR-1 protein and nucleic acid are used for diagnosing, preventing, treating or ameliorating a cardiovascular caberrant apoptosis modulation, enural disorder, disorder related to aberrant call acides modulation, a disorder, neural disorder, disorder related proliferated condition of the colon, memory, catablishment of short term memory, establishment of short term memory disorder associated with the brain, particularly memory disorders, movement coll disorder associated with the brain, particularly memory disorders, movement disorders that accompany severe trauma to the brain, disorder seculation, aberrant call transfers on the province that encurisment of memory of the disorder including parkinson's other forms of ataxia, disorder associated with the brain, particularly memory disorders that encurisment (many other diseases and specification). The invention provides human sequence that encodes a leucine-rich repeat containing protein with homology to the leucine-rich repeat containing protein known as NoGo receptor that is primarily expressed in the brain and is thought to be responsible for modulating neurite growth. The present sequence is a PCR primer used to isolate nucleic acid encoding a VH or VL chain of an anti-HLLRCR-1 antibody.

Novel isolated human G-protein chemokine receptor HSATU68 polypeptide, useful for preventing, treating or ameliorating medical conditions such as leukemia.

Example 13; SEQ ID NO 15; 168pp; English.

invention may also be used for the development of treatments for adult respiratory syndrome (ARDS), hyperproliferative disorders such as acute childhood lymphoblastic leukaemia, brain tumours, breast cancer, Kaposi's carlidhood lymphoblastic leukaemia, brain tumours, breast cancer, Kaposi's carcoma, Hodgkin's sarcoma, myeloid leukaemia and urethral cancer, gastrointestinal disorders such as intrahepatic cholestasis and cosophagitis, liver disorders such as intrahepatic cholestasis and islet cell tumours, gallbladder diseases such as intrahepatic cholestasis and nislet cell tumours, gallbladder diseases such as bile duct tumour, neurological diseases such as Alzheimer's disease, cardiovascular chearing such as cardiac oedema, pulmonary heart disease, reproductive disorders such as testicular atrophy, gonorrhoea, renal disorders such as testicular atrophy, gonorrhoea, renal disorders such as diabetes kidney failure, uninary disorders, endocrine disorders such as diabetes insipidua, for stimulating B-cell responsiveness to pathogens, an agent to increase serum immunoglobulin concentrations, to boost immunoresponsiveness among individuals having an acquired loss of B This invention relates to a novel isolated human G-protein chemokine receptor polypeptide (HSATU68) and the DNA sequence which encodes it. The invention may be useful for the development of compounds with a cytostatic, anti-HUV, antiinflammatcry, anti-diabetic, immunosuppressive, nootropic or neuroprotective activity which act as agonists or anti-HUV, and the invention. In addition, the invention may be useful for the development of a vaccine or for gene therapy. The invention is useful for diagnosing a pathological condition or a susceptibility to a pathological condition and for developing methods for treating, preventing diseases, disorders or conditions associated with aberrant expression and/or activity of the receptor of the invention such as infectious diseases which includes silicosis, sarcoidosis. The invention further comprises: a recombinant vector comprising the above nucleic acid molecule; a method of making a recombinant host cell comprising the above nucleic acid molecule; an isolated polypeptide comprising a sequence selected from: the full length protein or a polypeptide fragment, domain or epitope of a sequence having 727 amino acids or the encoded sequence included in ATCC Deposit Number PTA-4803, having neurotransmitter transporter activity; a polypeptide comprising amino acids or the encoded sequence having 727 amino acids minus the start methionine; and a polypeptide comprising amino acids 1-727 of the sequence having 727 amino acids in isolated antibody that binds specifically to the above polypeptide, a recombinant host cell produced by the above method and that expresses the above polypeptide; a method of making an isolated polypeptide; a method for preventing,
-cell function and as therapy for generation and/or regeneration of lymphoid tissues following surgery, trauma or genetic defect. The present sequence is that of a degenerate PCR primer which was used to amplify a region of a VH or VL gene during the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   immunosuppressive; neuroleptic; neuroprotective; hypotensive; phypotrensive; phypotensive; and algesic; anorectic; anabolic; antiparkinsonian; noctropic; tranquilizer; antiaddictive; hypnotic; gene therapy; dopamine; opicid peptide; serotonin; GABA; glutamate; primer; ss.

pathological condition or a susceptibility to a pathological condition in a subject. The human neurotransmitter transporter nucleic acid has the following activities: antidepressant, immunosuppressive, neuroleptic, neuroprotective, hypotensive, hypertensive, analgesic, anciectic, anabolic, antiparkinsonian, nootropic, tranguilizer, antiaddictive, and hypotensive in thuman neurotransmitter transporter nucleic acid can be used in gene therapy to treat disorders. The composition and methods are useful in diagnosing, preventing or treating a pathologic or medical condition selected from a disorder related to abbrrant neurotransmitter transport; affective disorders, immune-related disorders, hypotension, condition, endocrinal diseases, growth disorders, neurological disorders, metabolic disorders, immune-related disorders, hypotension, obesity, anorexia, bullmia, Parkinson's disease, dementias, behavioral disorders; cognitive disorders associated with aberrant serotonin expression and/or activity; anxiety, fear, depression, sleep, pain, disorders associated with aberrant maintenance of an attentive or alert state; attention deficit disorders; and sick and centre of the brain; disorders and field of the brain; disorders and alsorders 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
condition; and methods of diagnosing a
